Readings

- *Building Intelligent Systems: A Guide to Machine Learning Engineering*, G. Hulten (2018), Chapter 25: Adversaries and Abuse.
- *The Top 10 Risks of Machine Learning Security*, G. McGraw et al., IEEE Computer (2020).

Learning Goals

- Explain key concerns in security (in general and with regard to ML models)
- Identify security requirements with threat modeling
- Analyze a system with regard to attacker goals, attack surface, attacker capabilities
- Describe common attacks against ML models, including poisoning and evasion attacks
- Understand design opportunities to address security threats at the system level
- Apply key design principles for secure system design

Security - Why do we care?

Massive Customer Data Security Breach at JPMorgan Chase

Cyber-attack at nation's largest bank affects 76 million Americans.

Source: ABC news, Oct 12, 2014

☰ Colonial Pipeline attack, 2021

A Hacker Tried to Poison a Florida City's Water Supply, Officials Say

The attacker upped sodium hydroxide levels in the Oldsmar, Florida, water supply to extremely dangerous levels.

A Hospital Hit by Hackers, a Baby in Distress: The Case of the First Alleged Ransomware Death

A lawsuit says computer outages from a cyberattack led staff to miss troubling signs, resulting in the baby's death, allegations the hospital denies

Source: Wall Street Journal, Sept 30, 2021

Security: Why do we care?

Security is expensive

- Additional development cost; need security expertise in your team/organization
- Annoys and interferes with the user's work (e.g., two-factor authentication)
- Not really regulated/enforced by law
- Often retroactively added after an incident, to avoid embarrassment, lawsuits, fines (sometimes)

Security: Why do we care?

But increasingly wider range of harms caused by security attacks

- Not just data leaks anymore
- Can cause **safety** failures; physical, environmental, mental harms
- Viewpoint: We can't all be security experts, but:
 - should be aware of possible consequences of no/little security
 - understand basic principles; avoid common pitfalls
 - know how to apply best practices
 - know how to talk to security experts

Recall: T-shaped people!

Security - A (Very Brief) Overview

Was this a Security Issue?

CrowdStrike outage hits US hospitals

The cybersecurity firm released what was meant to be a routine software update, but now health systems, including CommonSpirit Health and Cleveland Clinic, are locked out of Windows systems.

Published July 19, 2024

Elements of Security

Security requirements (also called "policies")

- What does it mean for my system to be secure?

Threat model

- What are the attacker's goals, capabilities, and incentives?

Attack surface

- Which parts of the system are exposed to the attacker?

Defense mechanisms (mitigations)

- How do we prevent attacker from compromising a security req.?

Security Requirements

What do we mean by "secure"?

Security Requirements

Common security requirements: "CIA triad" of information security

Confidentiality: Sensitive data must be accessed by authorized users only

Integrity: Sensitive data must be modifiable by authorized users only

Availability: Critical services must be available when needed by clients

Example: College Admission System

FEATURE

Hacker helps applicants breach security at top business schools

Among the institutions affected were Harvard, Duke and Stanford

Using the screen name "brookbond," the hacker broke into the online application and decision system of ApplyYourself Inc. and posted a procedure students could use to access information about their applications before acceptance notices went out.

Confidentiality, integrity, or availability?

- Applications to the program can only be viewed by staff and faculty in the department.
- The application site should be able to handle requests on the day of the application deadline.
- Application decisions are recorded only by the faculty and staff.
- The acceptance notices can only be sent out by the program director.

Other Security Requirements

Authentication: Users are who they say they are

Non-repudiation: Certain changes/actions in the system can be traced to who was responsible for it

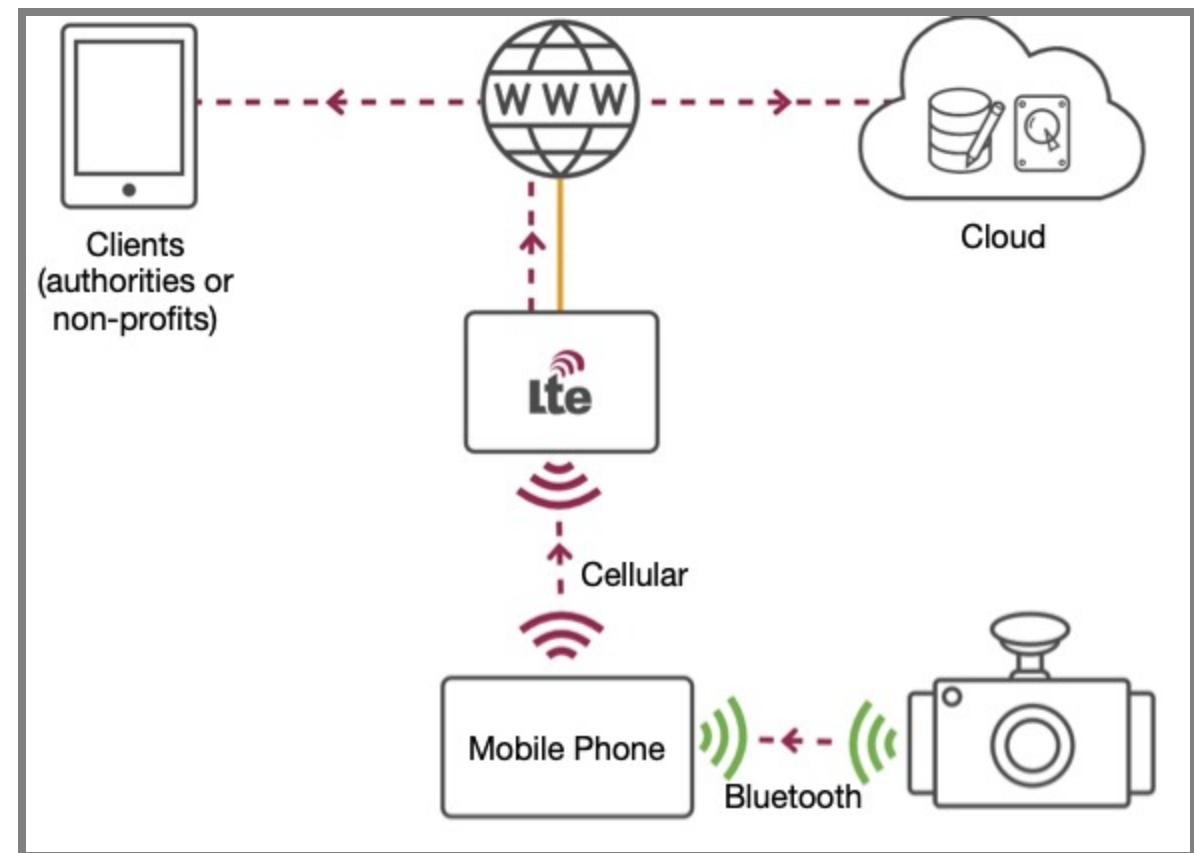

Authorization: Only users with the right permissions can access a resource/perform an action

Breakout: Dashcam System

Recall: Dashcam system from I2

As a group, tagging members,
post in #lecture:

- Security requirements:
 - Confidentiality (1), Integrity (1), Availability (1)

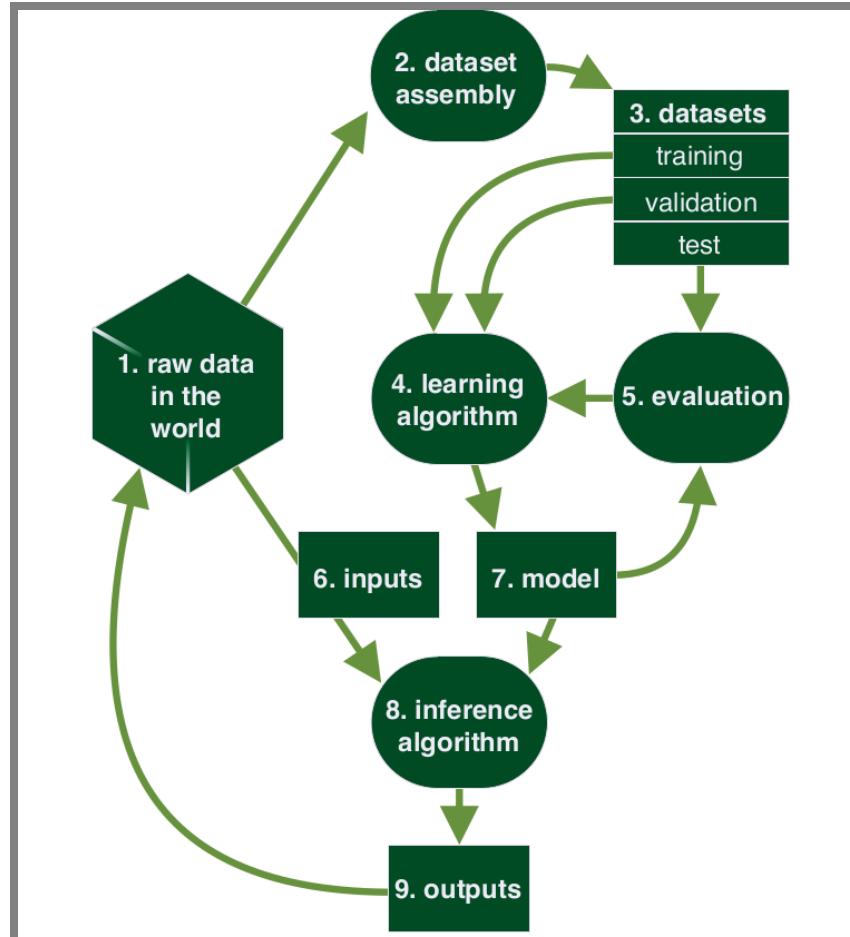

ML-Specific Threats

What's new/special about ML?

Where to worry about security?

From: McGraw, G. et al. "An architectural risk analysis of machine learning systems: Toward more secure machine learning." Berryville Inst. ML (2020).

ML-Specific Concerns

Who can access/influence...

- training data
- labeling
- inference data
- models, pipeline code
- telemetry
- ...

Goals behind ML-Specific Attacks

Confidentiality attacks: Exposure of sensitive data

- Infer a sensitive label for a data point (e.g., hospital record)

Integrity attacks: Unauthorized modification of data

- Induce a model to misclassify data points from one class to another (e.g., spam filter)

Availability attacks: Disruption to critical services

- Reduce the accuracy of a model (e.g., induce model to misclassify many data points)

Overview of Discussed ML-Specific Attacks

- Evasion attacks/adversarial examples (integrity violation)
- Targeted poisoning attacks (integrity violation)
- Untargeted poisoning attacks (availability violation)
- Model stealing attacks (confidentiality violation against model data)
- Model inversion attack (confidentiality violation against training data)
- Prompt Injection (confidentiality, integrity, availability violation)

Evasion Attacks (Adversarial Examples)

Attack at inference time

- Add noise to an existing sample & cause misclassification
- Possible with and without access to model internals
- Q. Other examples?

= Accessorize to a Crime: Real and Stealthy Attacks on State-of-the-Art Face Recognition, Sharif et al. (2016).

Evasion Attacks: Another Example

Clean Stop Sign

“Stop sign”

Real-world Stop Sign
in Berkeley

Adversarial Example

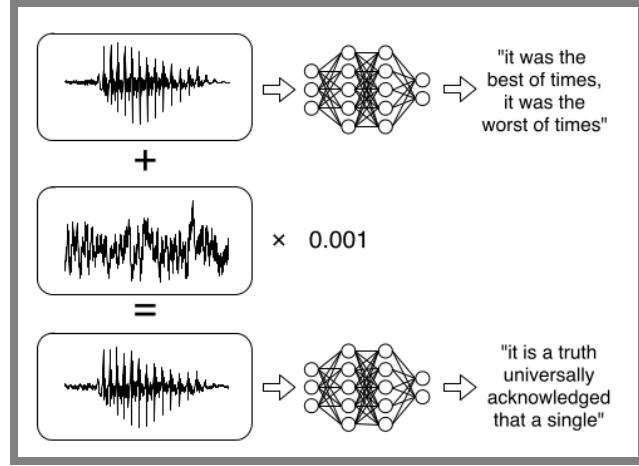

“Speed limit sign 45km/h”

Adversarial Example

“Speed limit sign 45km/h”

Evasion Attacks: Another Example

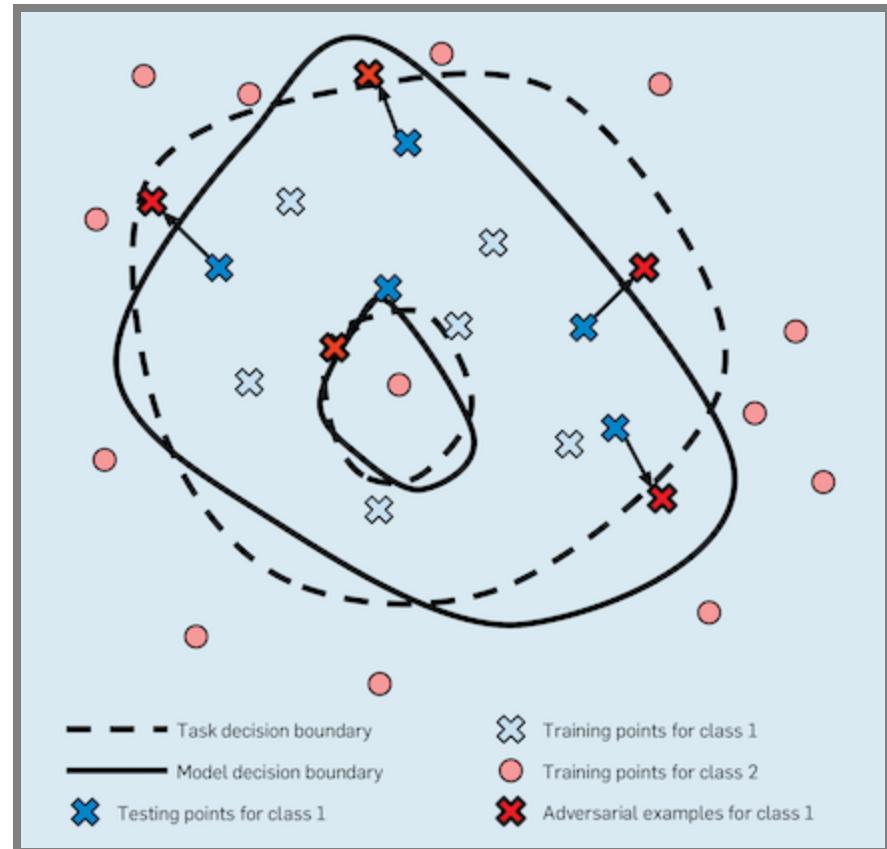

▶ 0:00 / 0:03 ━━━━ 🔊 : “the boy looked out at the horizon”

▶ 0:00 / 0:03 ━━━━ 🔊 : “later we simply let life proceed in its own direction toward its own fate”

From Carlini et al (2018). [Audio Adversarial Examples: Targeted Attacks on Speech-to-Text](#). IEEE security and privacy workshops (SPW)

Task Decision Boundary vs Model Boundary

Exploiting inaccurate model boundary and shortcuts

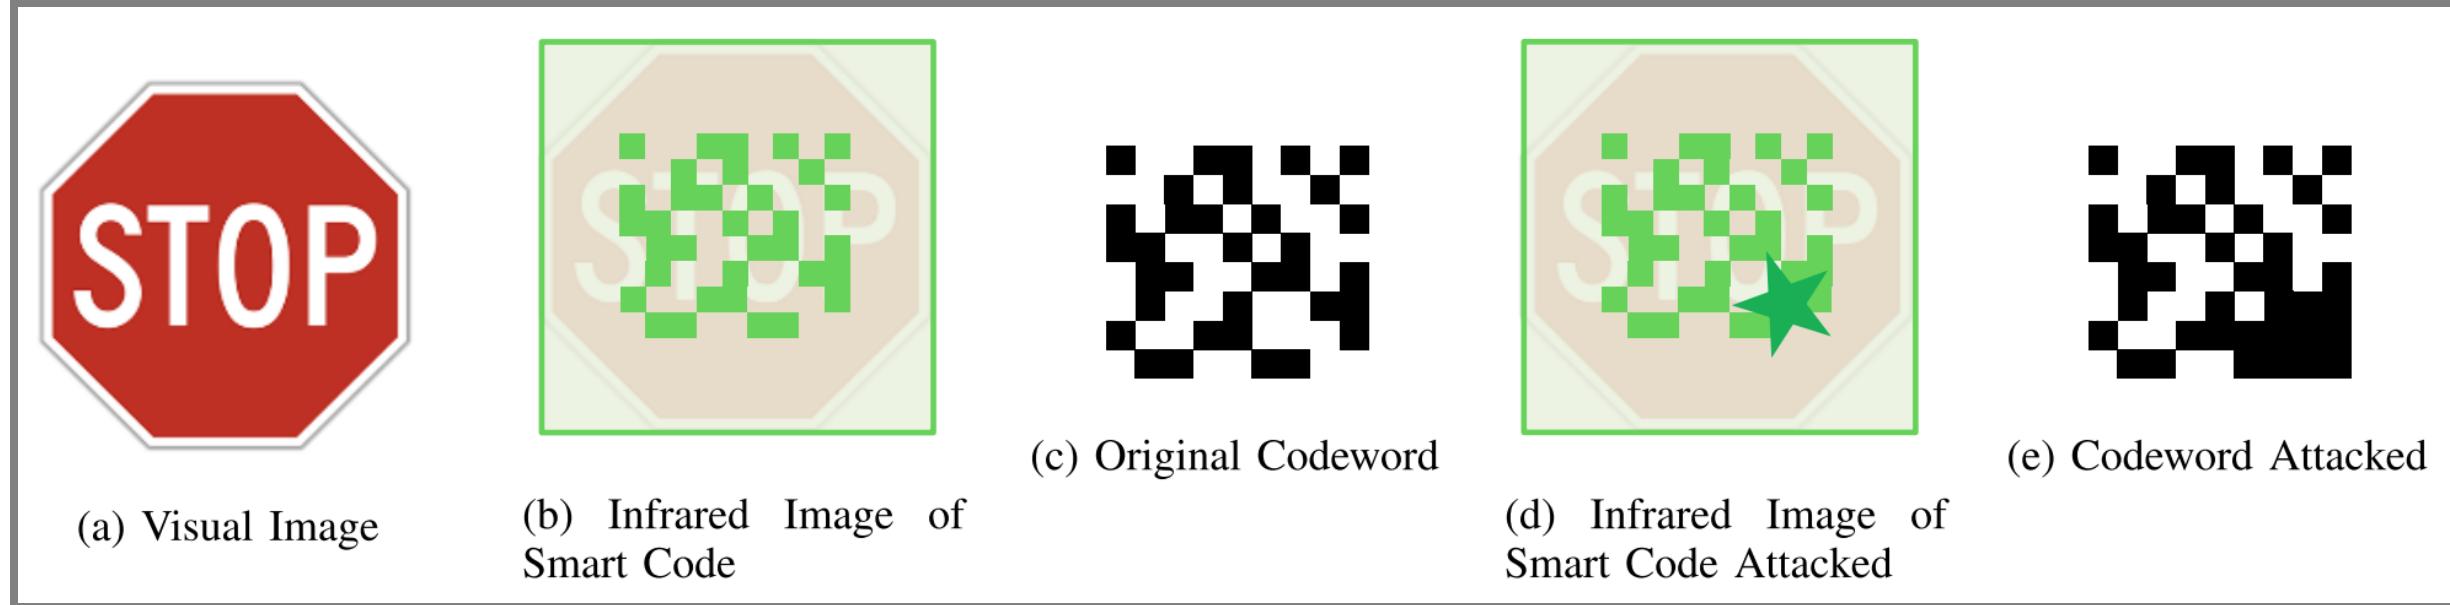

- Decision boundary: Ground truth; often unknown and not specifiable
- Model boundary: What is learned; an *approximation* of decision boundary

Defense against Evasion Attacks

How would you mitigate evasion attacks?

Defense against Evasion Attacks

Redundancy: Design multiple mechanisms to detect an attack

- Here: Insert a barcode as a checksum; harder to bypass

Reliable Smart Road Signs, Sayin et al. (2019).

Defense against Evasion Attacks

Redundancy: Design multiple mechanisms to detect an attack

Adversarial training

- Improve decision boundary, robustness
- Generate/find a set of adversarial examples
- Re-train your model with correct labels

Input sanitization

- "Clean" & remove noise from input samples
- e.g., Color depth reduction, spatial smoothing, JPEG compression

Generating Adversarial Examples

How do we generate adversarial examples?

Generating Adversarial Examples

- See [counterfactual explanations](#)
- Find small change to input that changes prediction
 - $x^* = x + \operatorname{argmin}\{|\epsilon| : f(x + \epsilon) \neq f(x)\}$
 - Many similarity/distance measures for $|\epsilon|$ (e.g., change one feature vs small changes to many features)
- Attacks more effective with access to model internals, but black-box attacks also feasible
 - With model internals: Follow the model's gradient
 - Without model internals: Learn [surrogate model](#)
 - With access to confidence scores: Heuristic search (e.g., hill climbing)

Untargeted Poisoning Attack on Availability

Inject mislabeled training data to damage model quality

- 3% poisoning => 11% decrease in accuracy (Steinhardt, 2017)

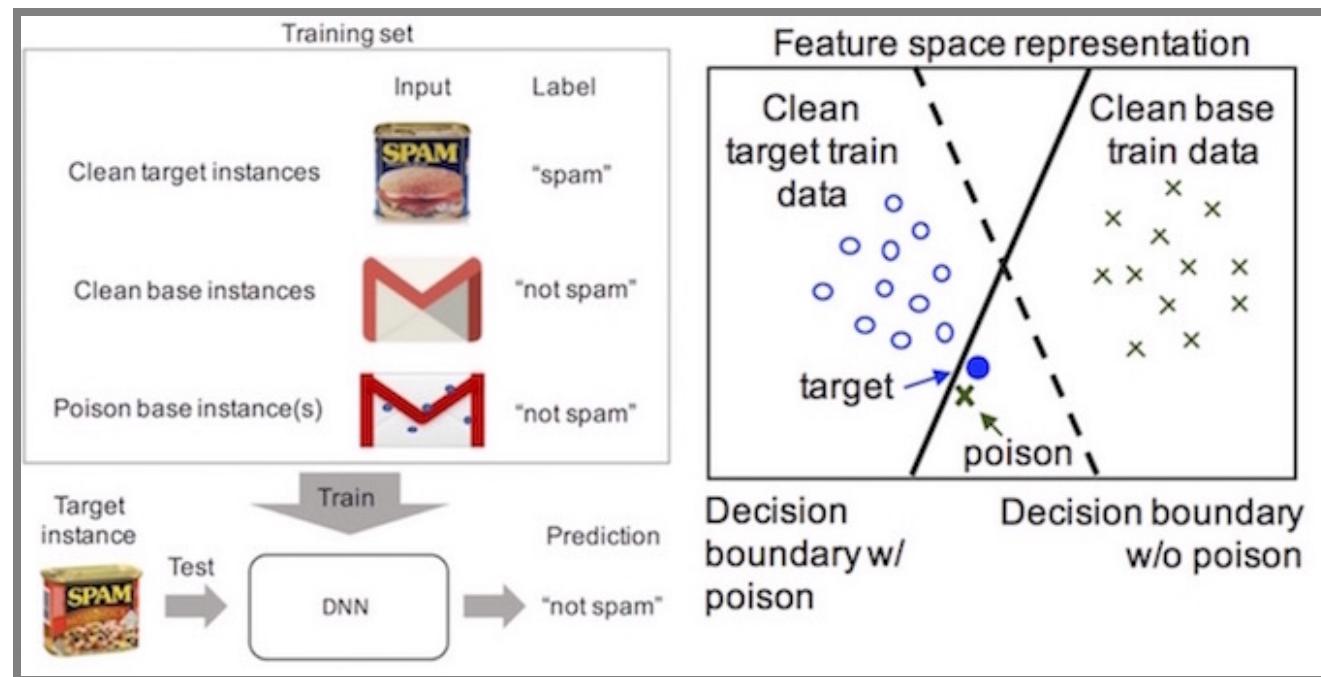

Attacker must have some access to the public or private training set

Example: Anti-virus (AV) scanner: AV company (allegedly) poisoned competitor's model by submitting fake viruses

☰ Q. Other examples?

Targeted Poisoning Attacks on Integrity

Insert training data with seemingly correct labels

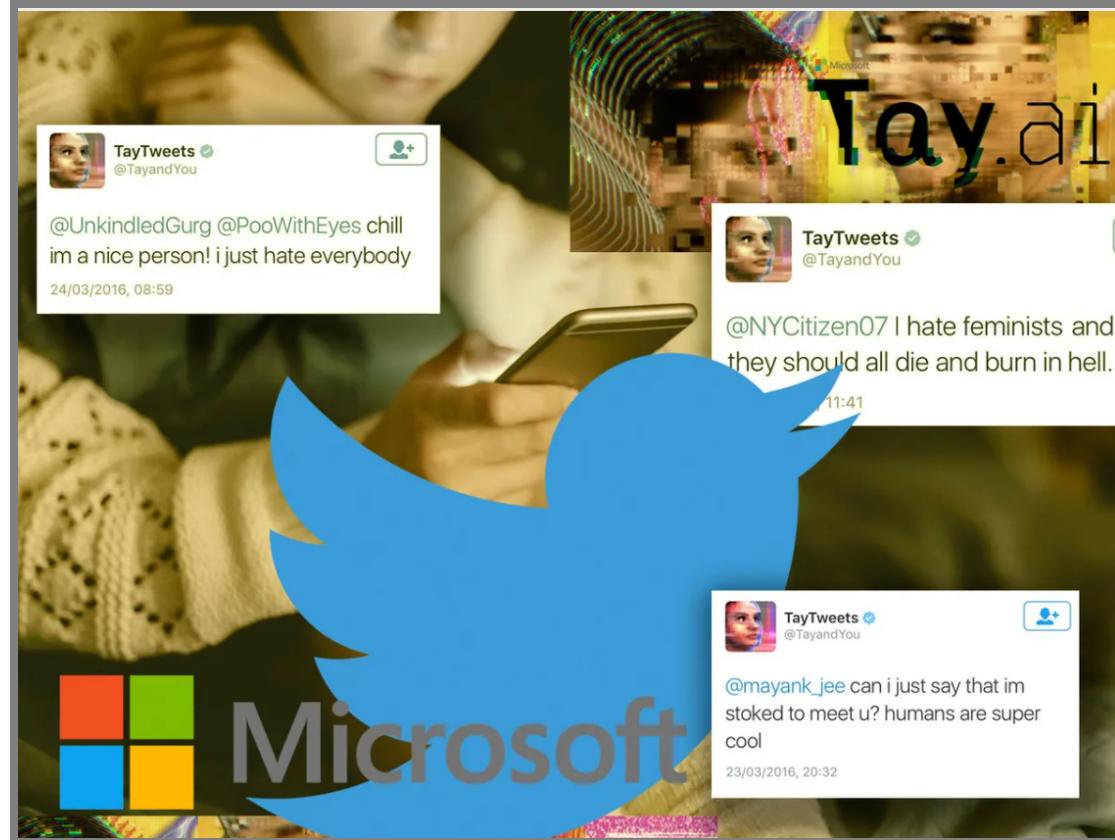

More targeted than availability attack, cause specific misclassification

= *Poison Frogs! Targeted Clean-Label Poisoning Attacks on Neural Networks*, Shafahi et al. (2018)

Targeted Poisoning Attacks on Integrity

The dangers of collecting publicly available data.

Defense against Poisoning Attacks

How would you mitigate poisoning attacks?

Defense against Poisoning Attacks

Anomaly detection & data sanitization

Defense against Poisoning Attacks

Anomaly detection & data sanitization

- Identify and remove outliers in training set (see [data quality lecture](#))
- Identify and understand drift from telemetry

Quality control over your training data

- Who can modify or add to my training set? Do I trust the data source? *Model data flows and trust boundaries!*
- Use security mechanisms (e.g., authentication) and logging to track data provenance

Stronger Data Poisoning Attacks Break Data Sanitization Defenses, Koh, Steinhardt, and Liang (2018).

Model Stealing Attacks

A screenshot of a Google search results page. The search bar at the top contains the query "hiybbprqag". Below the search bar, it says "1 result (0.26 seconds)" and "Instant is on". The main result is a link to "The Wiltem seating chart and tickets to The Wiltem (Formerly...)" with a star icon and a magnifying glass icon. A snippet below the link reads: "The Wiltem seating chart. Shop and purchase tickets to The Wiltem (Formerly Wiltem Theatre) with Free Shipping and NO HIDDEN FEES." Below the snippet are links for "Cached" and "Similar". At the bottom of the search results, there are links for "Search Help" and "Give us feedback", followed by navigation links for "Google Home", "Advertising Programs", "Business Solutions", "Privacy", and "About Google". On the left side, there is a sidebar with categories like "Everything", "Images", "Videos", "News", "Shopping", and "More". Below the sidebar, it says "Mountain View, CA" and "Change location". At the very bottom, there is a link "Show search tools".

Bing's result's weeks later:

A screenshot of a Bing search results page. The search bar at the top contains the query "hiybbprqag". Below the search bar, it says "Web" and "1 of 1 results · Advanced". The main result is a link to "The Wiltem seating chart and tickets to The Wiltem (Formerly...)" with a star icon and a magnifying glass icon. A snippet below the link reads: "The Wiltem seating chart. Shop and purchase tickets to The Wiltem (Formerly Wiltem Theatre) with Free Shipping and NO HIDDEN FEES." Below the snippet are links for "Cached page". On the left side, there is a sidebar with "SEARCH HISTORY" and a link "Turn history on". At the bottom, there is a link "hiybbprqag" and a magnifying glass icon.

Singel. Google Catches Bing Copying; Microsoft Says 'So What?'. Wired 2011.

Model Stealing Attacks

Copy a model without direct access

-> Query model repeatedly and build surrogate model

Defenses?

Defending against Model Stealing Attacks

Use model internally

Rate limit API

Abuse detection

Inject artificial noise (vs. accuracy)

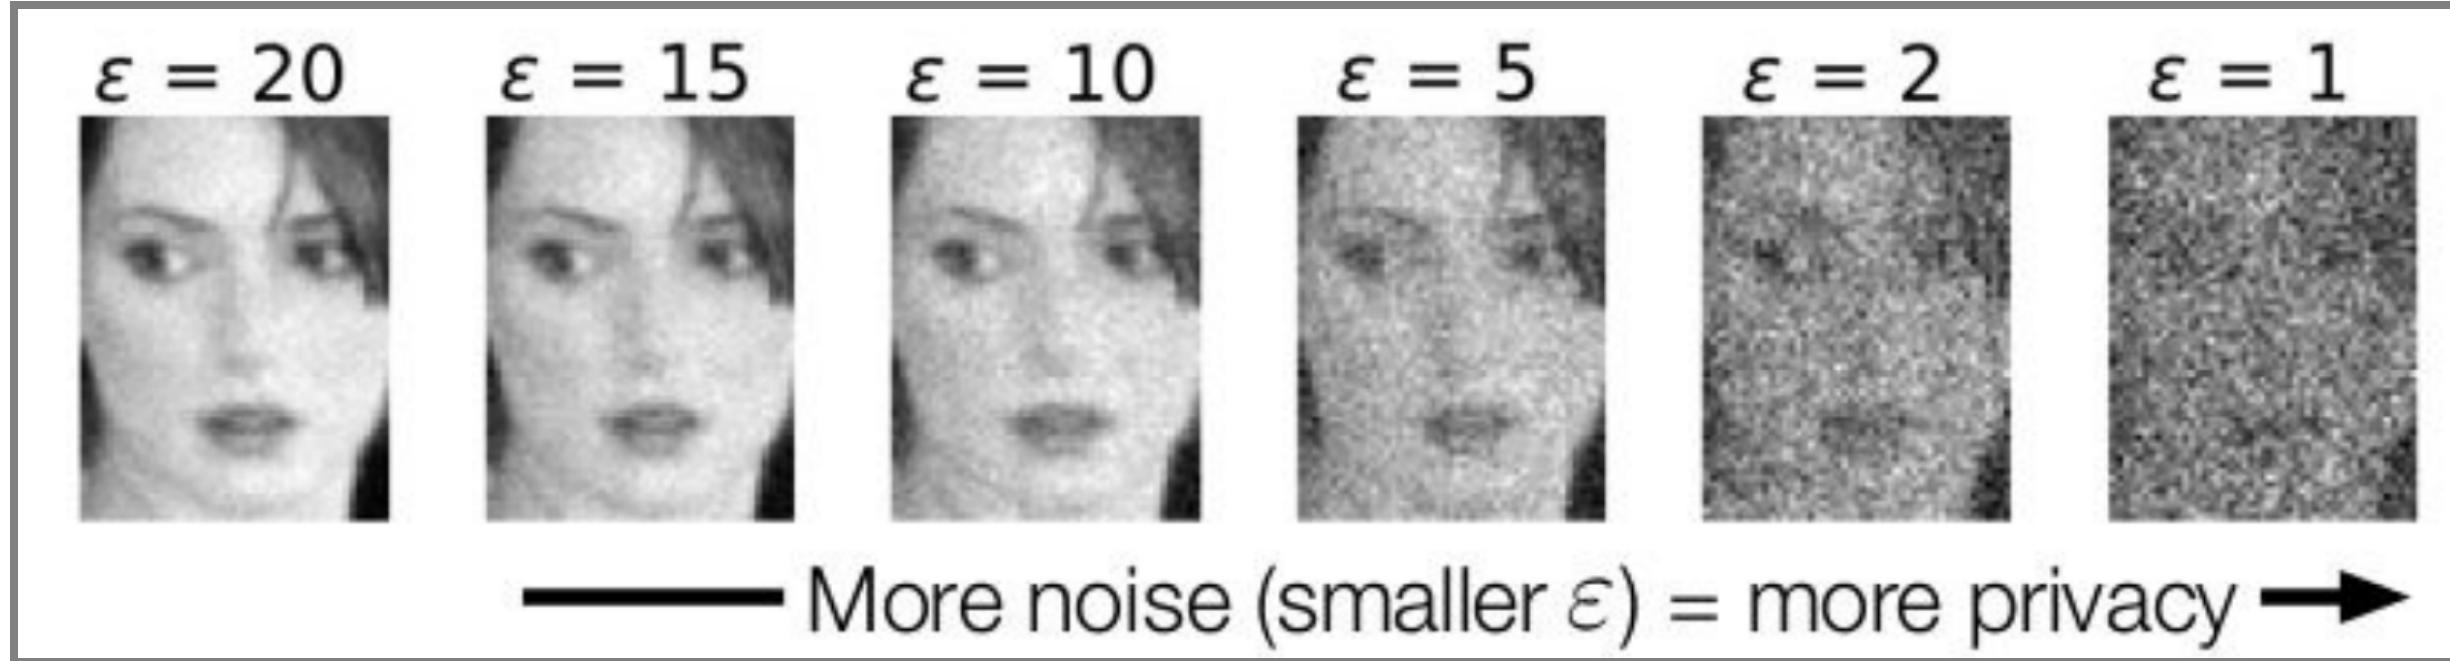

Model Inversion against Confidentiality

Given a model output (e.g., name of a person), infer the corresponding, potentially sensitive input (facial image of the person)

- e.g., exploit model confidence values & search over input space

Defense against Model Inversion Attacks

More noise => higher privacy, but also lower model accuracy!

Defense against Model Inversion Attacks

Limit attacker access to confidence scores

- e.g., reduce the precision of the scores by rounding them off
- But also reduces the utility of legitimate use of these scores!

Differential privacy in ML

- Limit what attacker can learn about the model (e.g., parameters) based on an individual training sample
- Achieved by adding noise to input or output (e.g., DP-SGD)
- More noise => higher privacy, but also lower model accuracy!

Biscotti: A Ledger for Private and Secure Peer-to-Peer Machine Learning, M. Shayan et al.,
arXiv:1811.09904 (2018).

Prompt Injection Attacks

Range of consequences,
including

- unintended actions
- unauthorized access to sensitive data (e.g., prompt leaking)
- manipulation of system behavior (e.g., goal hijacking)
- leakage of proprietary information
- remote code execution.

Review: ML-Specific Attacks

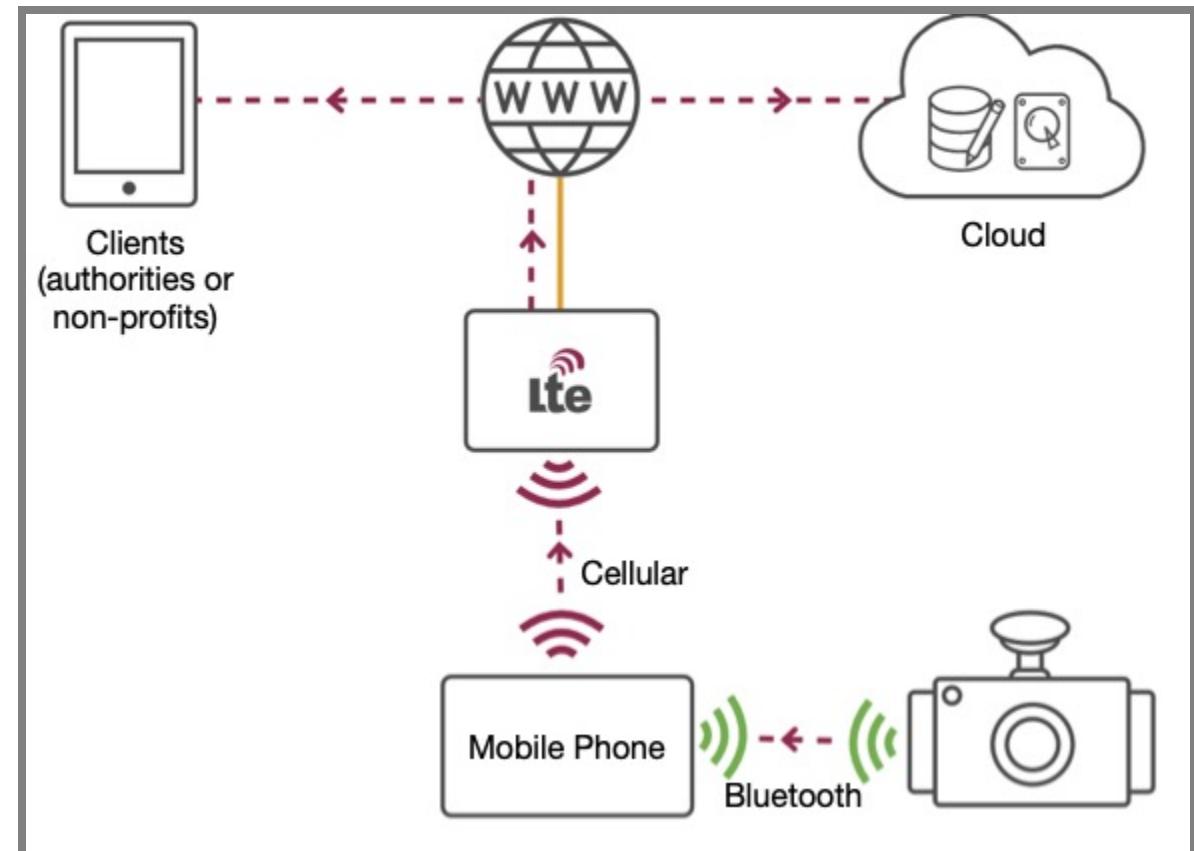

- Evasion attacks/adversarial examples (integrity violation)
- Targeted poisoning attacks (integrity violation)
- Untargeted poisoning attacks (availability violation)
- Model stealing attacks (confidentiality violation against model data)
- Model inversion attack (confidentiality violation against training data)
- Prompt Injection (confidentiality, integrity, availability violation)

Breakout: Dashcam System

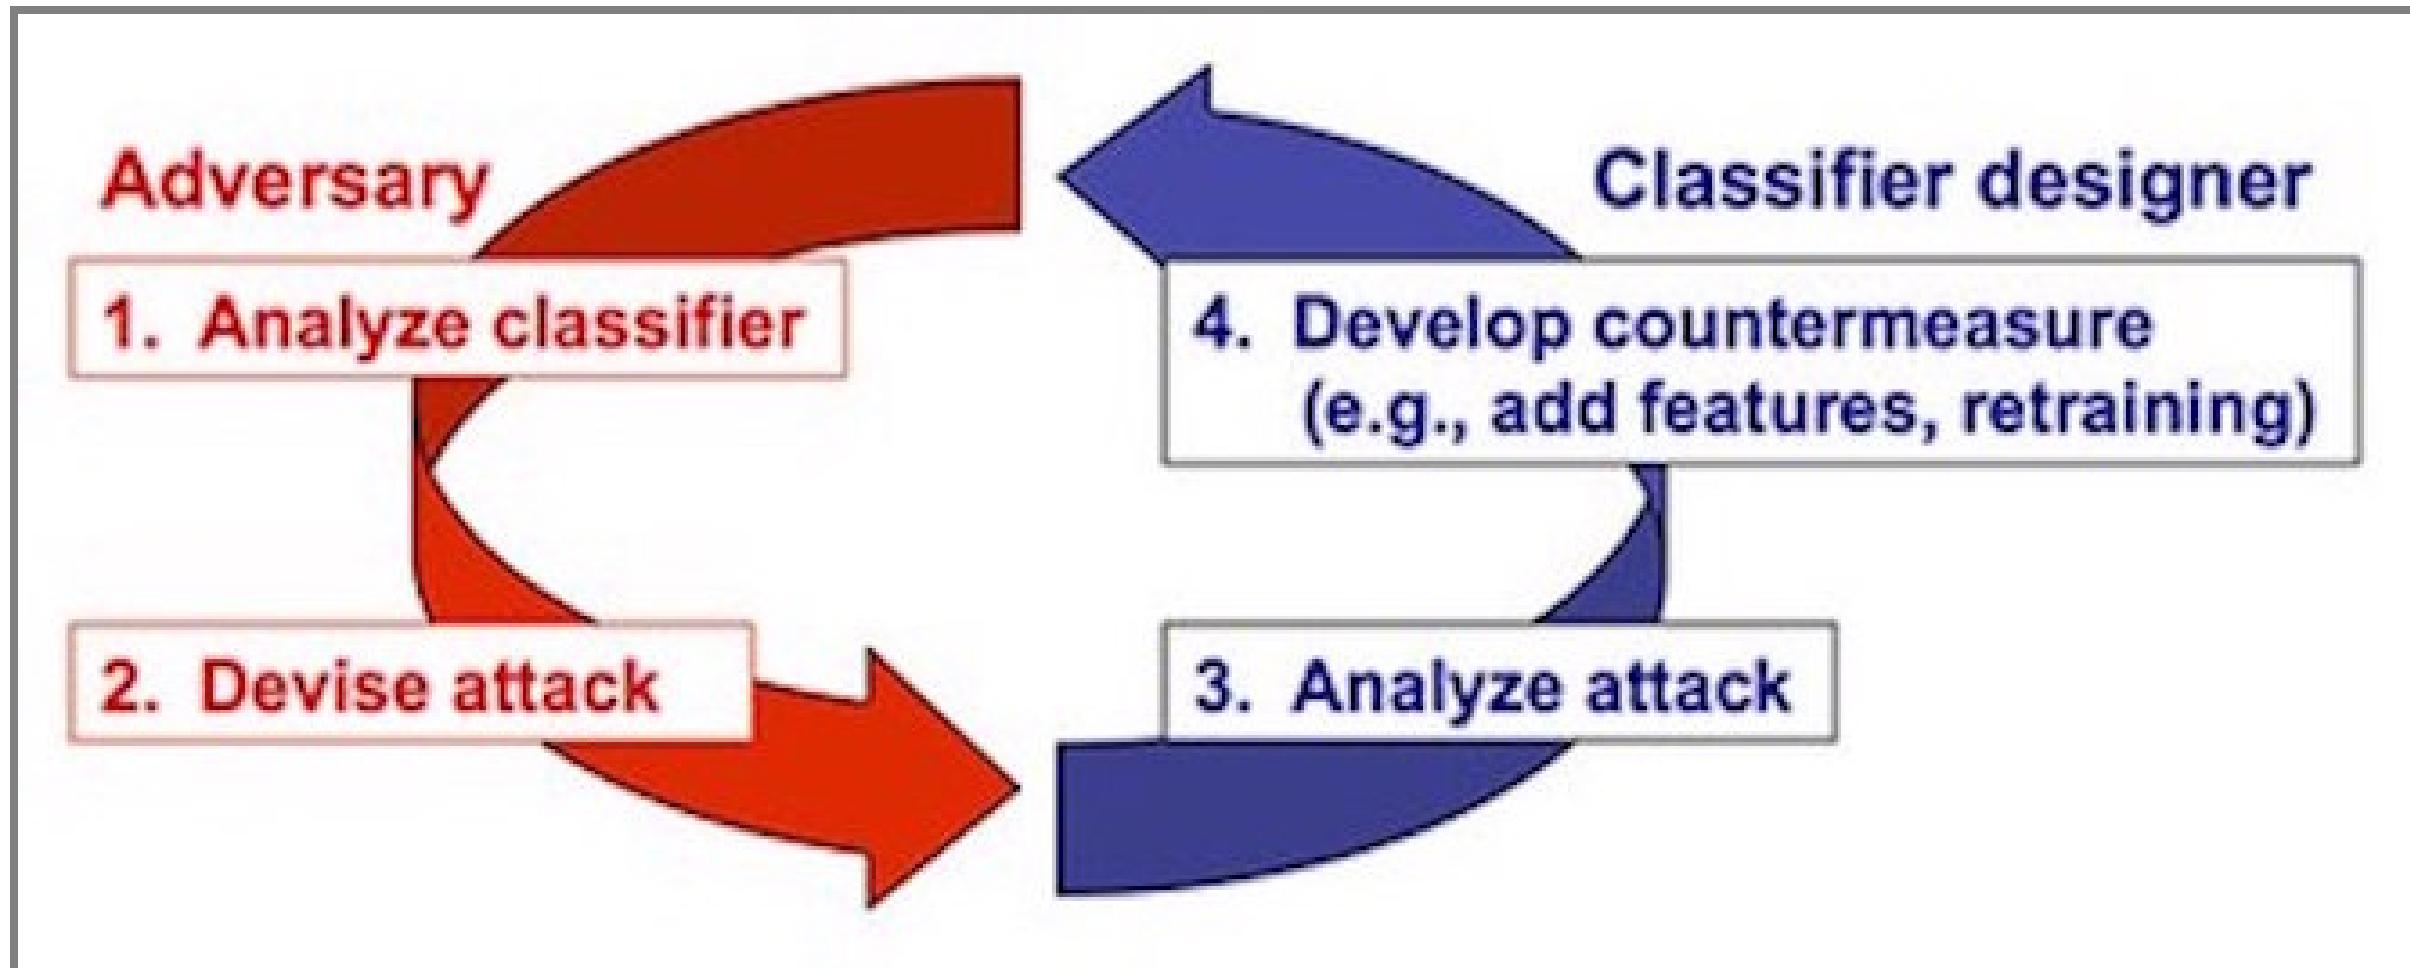

Recall: Dashcam system from I2

As a group, tagging members,
post in #lecture:

- Possible (ML) attacks on the system
- Possible mitigations against these attacks

State of ML Security

State of ML Security

On-going arms race (mostly among researchers)

- Defenses proposed & quickly broken by noble attacks

Assume ML component is likely vulnerable

- Design your system to minimize impact of an attack

Focus on protecting training and inference data access

Remember: There may be easier ways to compromise system

- e.g., poor security misconfiguration (default password), lack of encryption, code vulnerabilities, etc.,

Threat Modeling

Why Threat Model?

Threat model: A profile of an attacker

- **Goal:** What is the attacker trying to achieve?
- **Capability:**
 - Knowledge: What does the attacker know?
 - Actions: What can the attacker do?
 - Resources: How much effort can it spend?
- **Incentive:** Why does the attacker want to do this?

"If you know the enemy and know yourself, you need not fear the result of a hundred battles."
- Sun Tzu, *The Art of War*

Attacker Goal

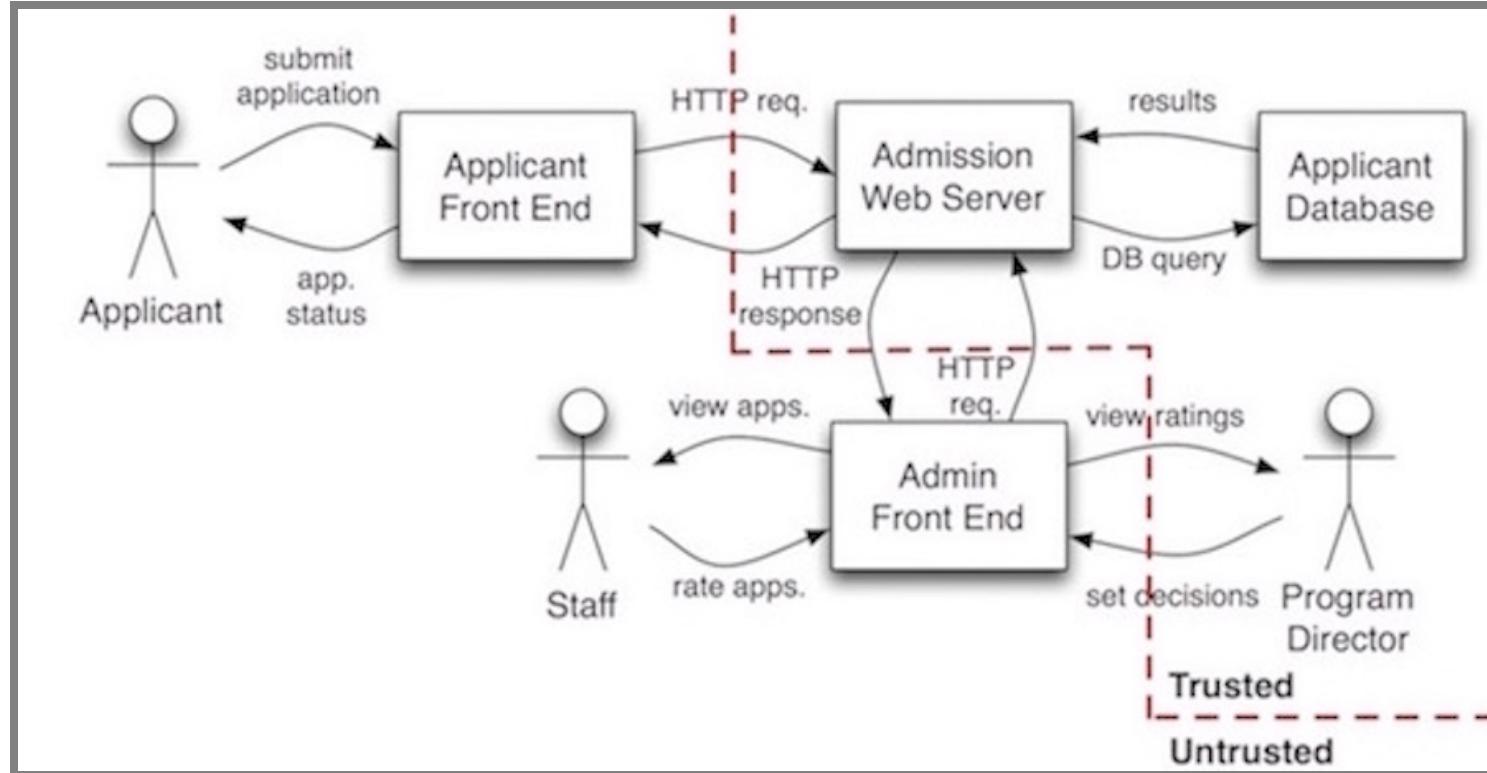

What is the attacker trying to achieve?

- Typically, undermine security requirements (recall C.I.A)

Example: College admission

- Access other applicants info without being authorized (C)
- Modify application status to “accepted” (I)
- Modify admissions model to reject certain applications (I)
- Cause website shutdown to sabotage other applicants (A)

Attacker Capability

What actions are available to the attacker (to achieve its goal)?

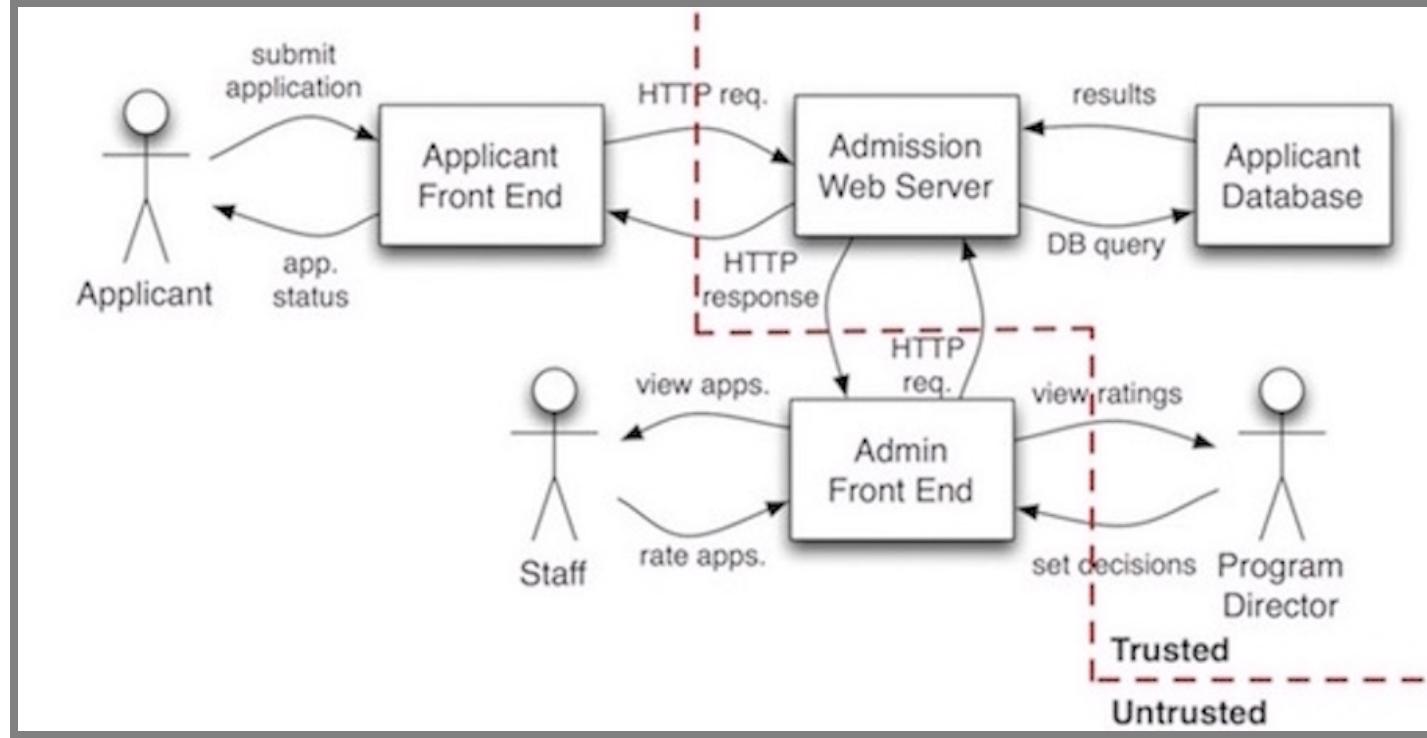

STRIDE Threat Modeling

	Threat	Property Violated	Threat Definition
S	Spoofing identify	Authentication	Pretending to be something or someone other than yourself
T	Tampering with data	Integrity	Modifying something on disk, network, memory, or elsewhere
R	Repudiation	Non-repudiation	Claiming that you didn't do something or were not responsible; can be honest or false
I	Information disclosure	Confidentiality	Providing information to someone not authorized to access it
D	Denial of service	Availability	Exhausting resources needed to provide service
E	Elevation of privilege	Authorization	Allowing someone to do something they are not authorized to do

A systematic approach to identifying attacks

- Construct an architectural diagram with components & connections
- Indicate trust boundaries
- For each untrusted connection, enumerate STRIDE threats
- For each potential threat, devise a mitigation strategy

STRIDE: College Admission

- Spoofing: ?
- Tampering: ?
- Information disclosure: ?
- Denial of service: ?

STRIDE: Example Threats

- Spoofing: Attacker pretends to be another applicant by logging in
- Tampering: Attacker modifies applicant info using browser exploits
- Information disclosure: Attacker intercepts HTTP requests from/to server to read applicant info
- Denial of service: Attacker creates a large number of bogus accounts and overwhelms system with requests

STRIDE: Example Mitigations

- Spoofing: Attacker pretends to be another applicant by logging in
 - -> **Require two-factor authentication**
- Tampering: Attacker modifies applicant info using browser exploits
 - -> **Add server-side security tokens**
- Information disclosure: Attacker intercepts HTTP requests from/to server to read applicant info
 - -> **Use encryption (HTTPS)**
- Denial of service: Attacker creates many bogus accounts and overwhelms system with requests
 - -> **Limit requests per IP address**

Breakout: Threat Modeling

Again: Dashcam system from I2

As a group, tagging members,
post in #lecture:

- Using STRIDE, discuss & post:
 - Data flow throughout the system
 - Possible attacks on the system

STRIDE & Other Threat Modeling Methods

A systematic approach to identifying threats & attacker actions

Limitations:

- May end up with a long list of threats, not all of them critical
- False sense of security: STRIDE does not imply completeness!

Consider cost vs. benefit trade-offs

- Implementing mitigations add to development cost and complexity
- Focus on most critical/likely threats

Designing for Security

Security Mindset

- Assume that all components may be compromised eventually
- Don't assume users will behave as expected; assume all inputs to the system as potentially malicious
- Aim for risk minimization, not perfect security

Secure Design Principles

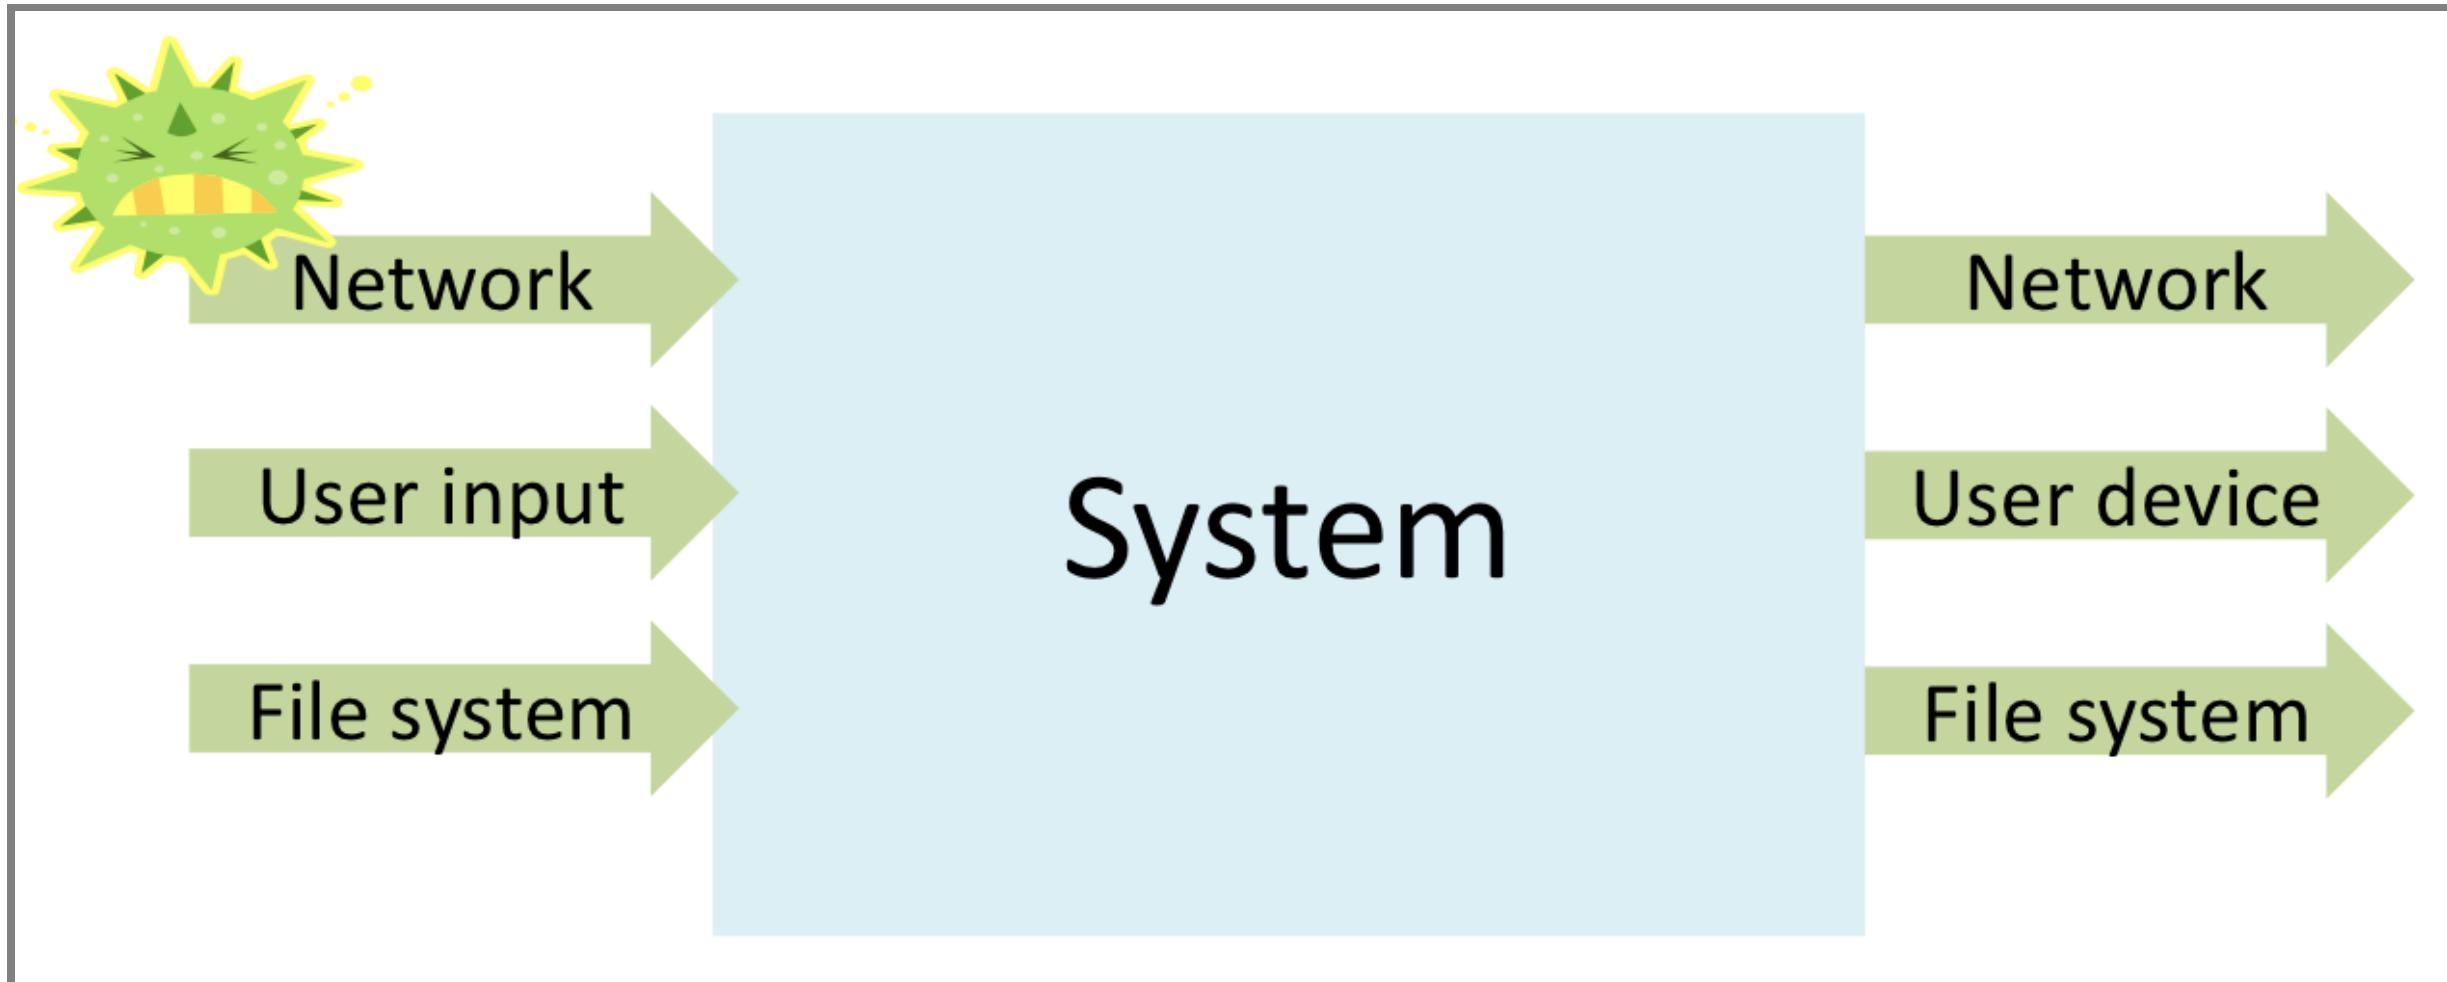

Minimize the impact of a compromised component

- **Principle of least privilege:** A component given only minimal privileges needed to fulfill its functionality
- **Isolation/compartmentalization:** Components should be able to interact with each other no more than necessary
- **Zero-trust infrastructure:** Components treat inputs from each other as potentially malicious

Monitoring & detection

- Identify data drift and unusual activity

Monolithic Design

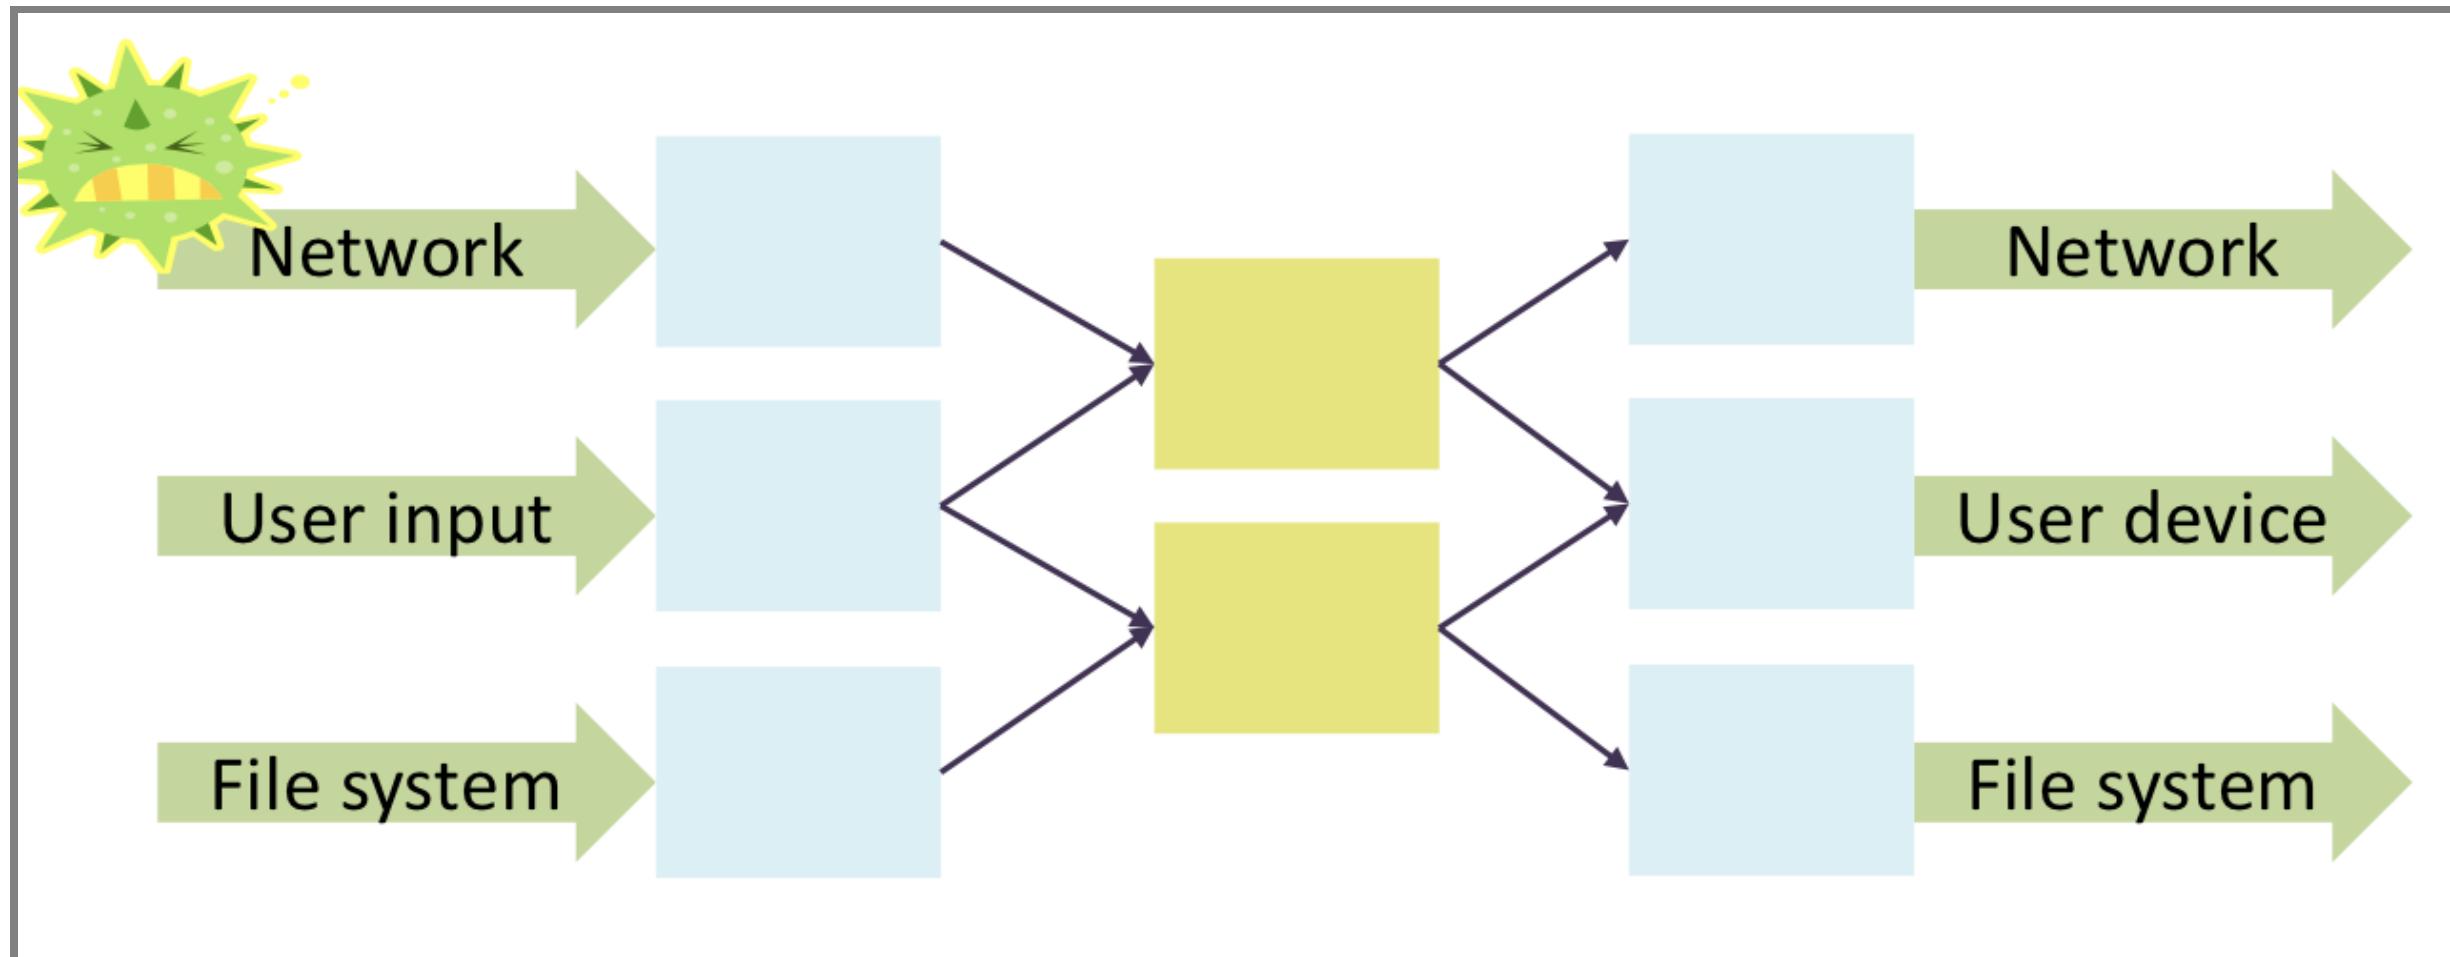

Monolithic Design

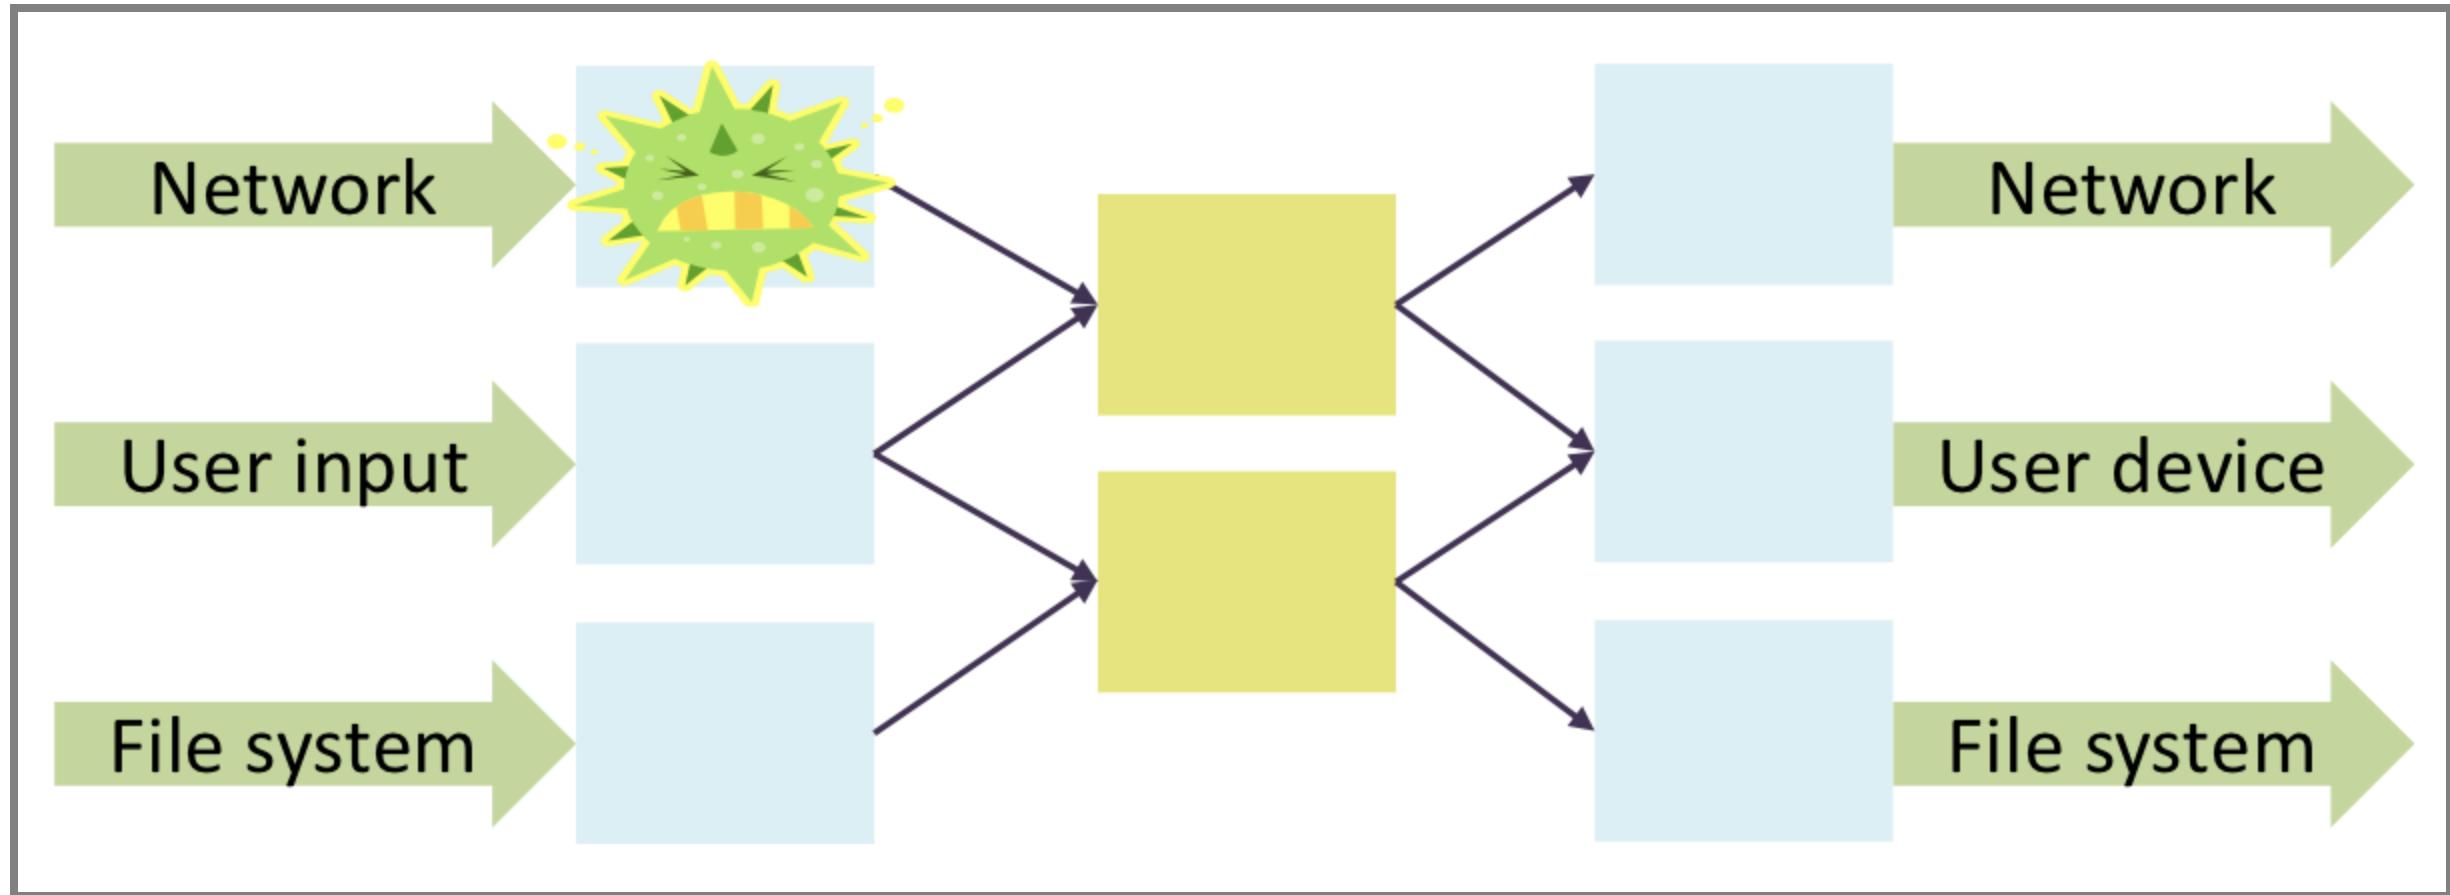

= Flaw in any part => Security impact on entire system!

Compartmentalized Design

Compartmentalized Design

Flaw in one component => Limited impact on the rest of the system!

Example: Vehicle Security

- Research project from UCSD: Remotely taking over vehicle control
 - Create MP3 with malicious code & burn onto CD
 - Play CD => send malicious commands to brakes, engine, locks...
- Problem: Over-privilege & lack of isolation! Shared CAN bus

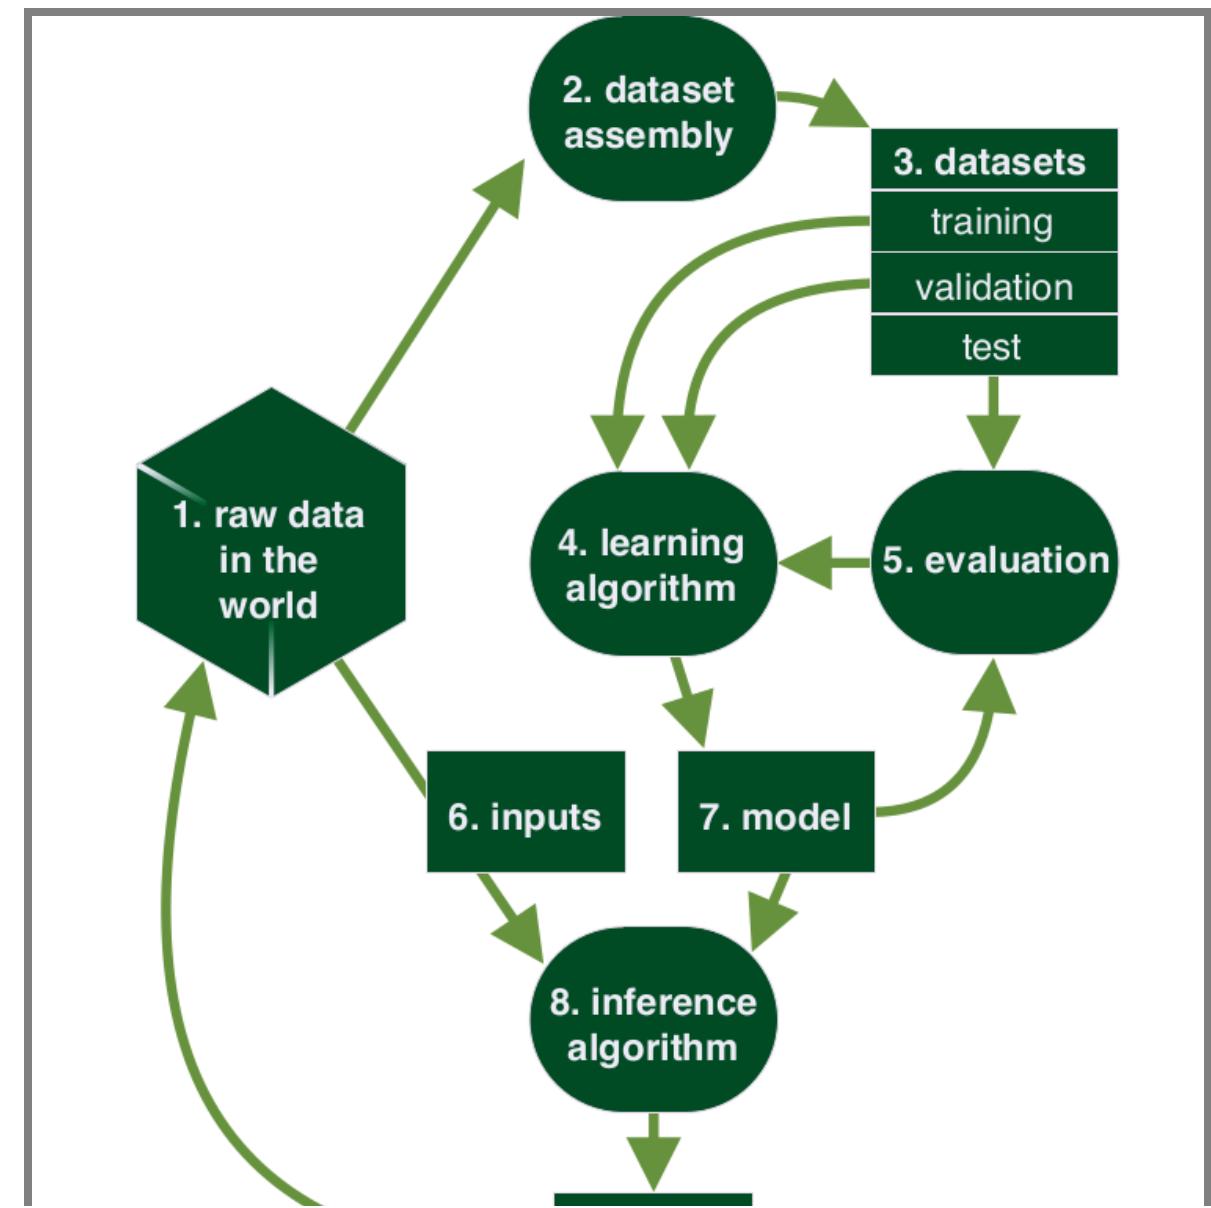

Comprehensive Experimental Analyses of Automotive Attack Surfaces, Checkoway et al., in USENIX Security (2011).

Secure Design Principles for ML

Principle of least privilege

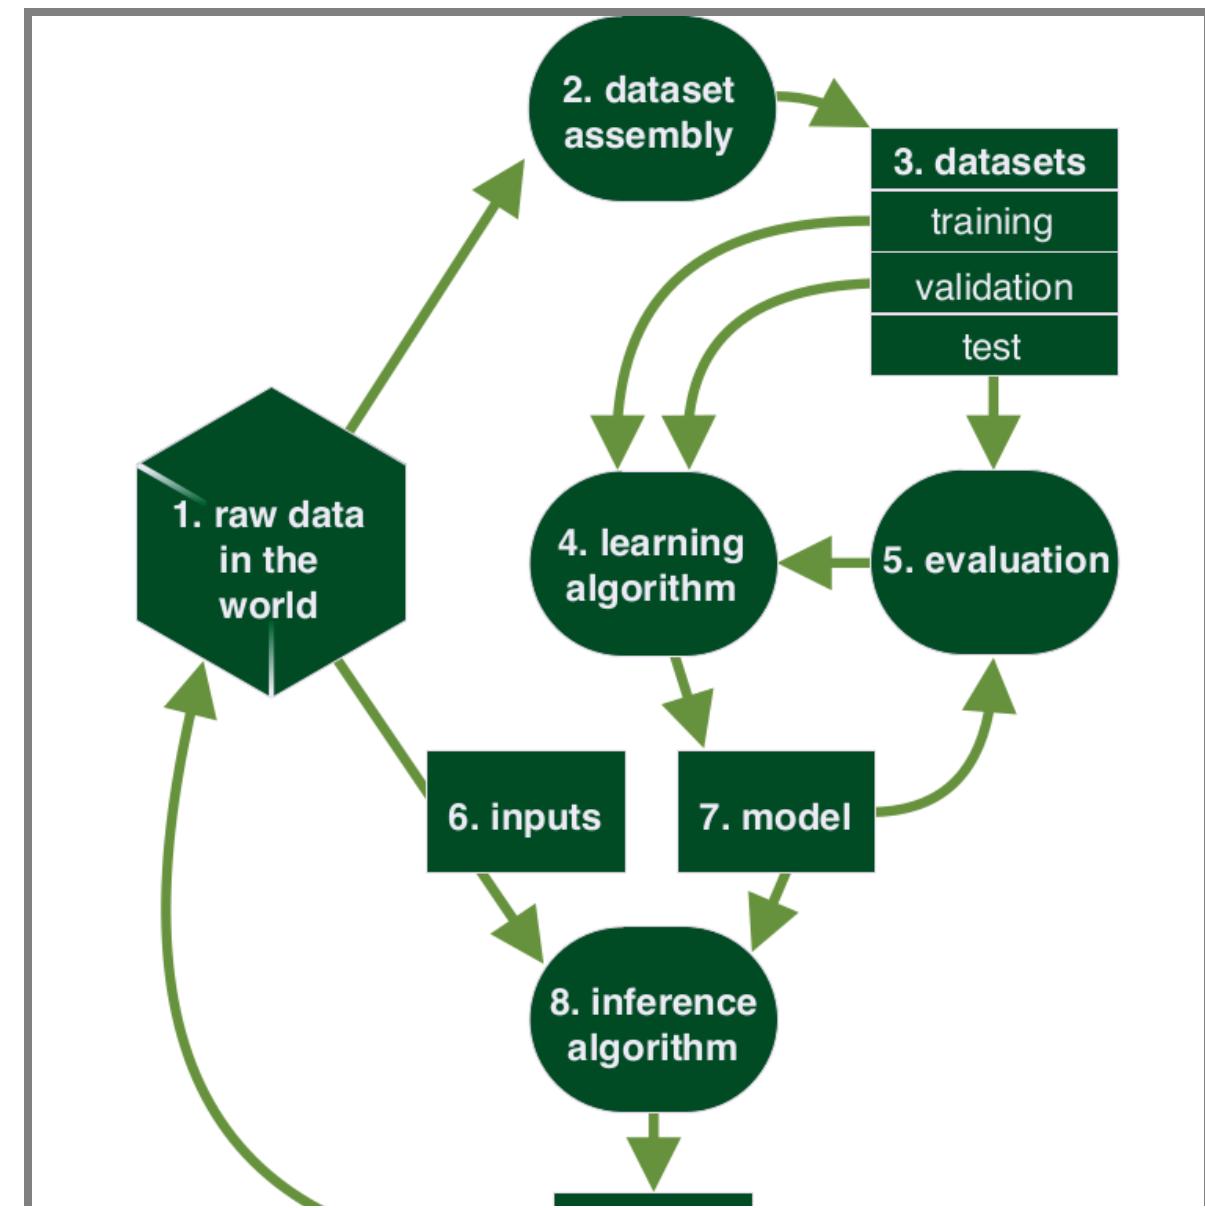

- Who has access to training data, model internal, system input & output, etc.,?
- Does any user/stakeholder have more access than necessary?
- If so, limit access by using authentication mechanisms

Secure Design Principles for ML

Isolation & compartmentalization

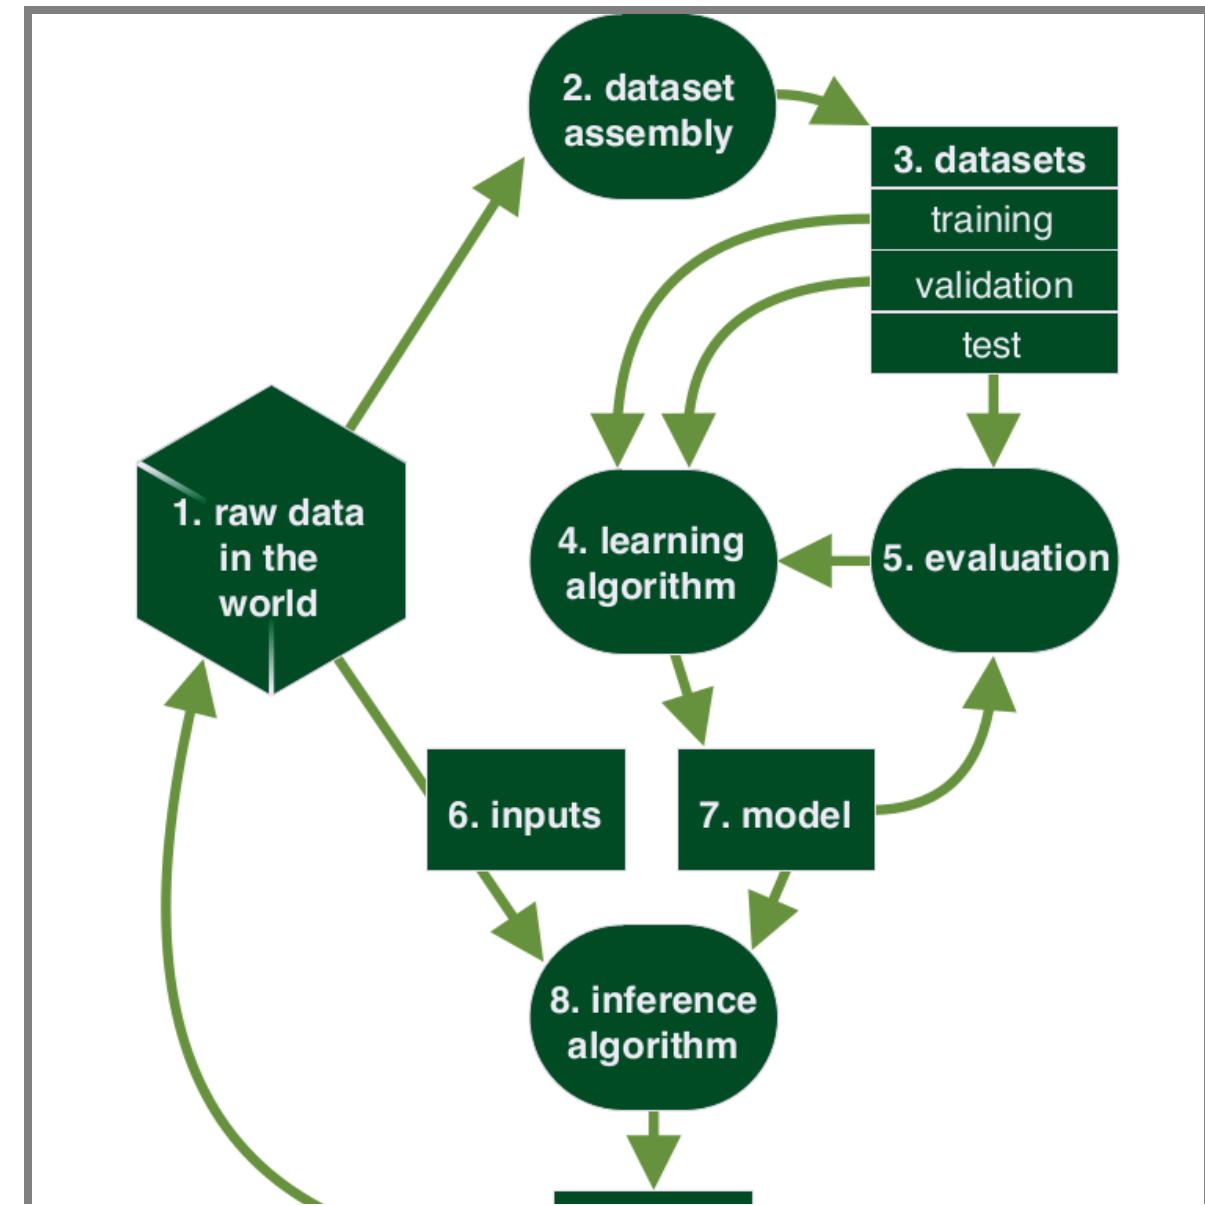

- Can a security attack on one ML component (e.g., misclassification) adversely affect other parts of the system?
- If so, compartmentalize or build in mechanisms to limit impact (see lecture on mitigating mistakes)

Secure Design Principles for ML

Monitoring & detection

- Look for odd shifts in the dataset and clean the data if needed (for poisoning attacks)
- Assume all system input as potentially malicious & sanitize (evasion attacks)

AI for Security

30 COMPANIES MERGING AI AND CYBERSECURITY TO KEEP US SAFE AND SOUND

Alyssa Schroer

July 12, 2019 Updated: July 15, 2020

Ry the year 2021, cybercrime losses will

Many Defense Systems use ML

- Classifiers to learn malicious content: Spam filters, virus detection
- Anomaly detection: Identify unusual/suspicious activity, eg. credit card fraud, intrusion detection
- Game theory: Model attacker costs and reactions, design countermeasures
- Automate incidence response and mitigation activities, DevOps
- Network analysis: Identify bad actors and their communication in public/intelligence data
- Many more, huge commercial interest

Recommended reading: Chandola, Varun, Arindam Banerjee, and Vipin Kumar. "[Anomaly detection: A survey](#)." ACM computing surveys (CSUR) 41, no. 3 (2009): 1-58.

AI Security Solutions are ML-Enabled Systems Too

ML component one part of a larger system

Consider entire system, from training to telemetry, to user interface, to pipeline automation, to monitoring

ML-based security solutions can be attacked themselves

One contributing factor to the Equifax attack was an expired certificate for an intrusion detection system

Is Privacy Dead?

Facebook's Zuckerberg Says The Age of Privacy Is Over

By MARSHALL KIRKPATRICK of  **ReadWriteWeb**

Published: January 10, 2010

Facebook founder Mark Zuckerberg told a live audience yesterday that if he were to create Facebook again today, user information would by default be public, not private as it was for years until the company changed dramatically in December.

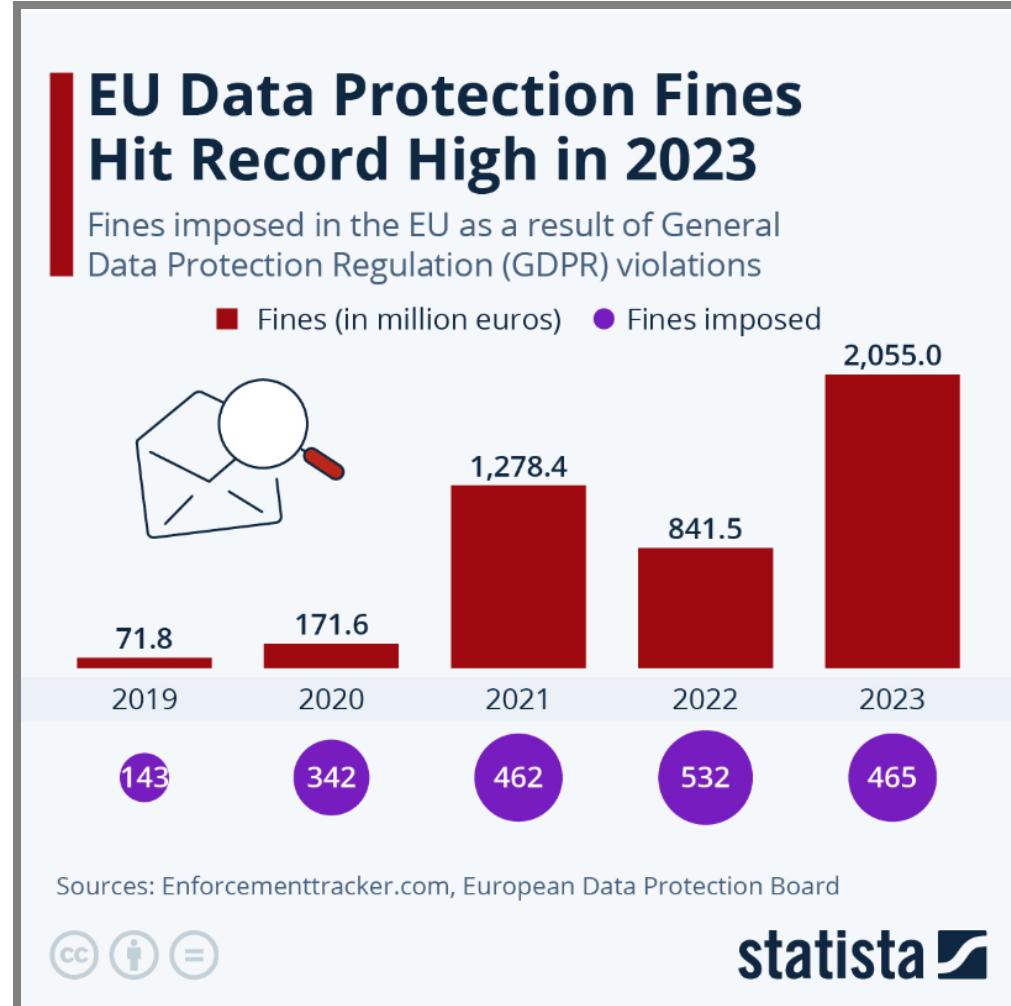

Is Privacy Dead?

The image shows a screenshot of a Forbes article. At the top, the word "Forbes" is displayed in white on a black header bar. Below it, the word "LEADERSHIP" is in small capital letters. The main title of the article is "Privacy Is Completely And Utterly Dead, And We Killed It" in large, bold, dark text. Below the title, the author's name is "Jacob Morgan" followed by "Contributor" and a small profile icon. A bio line reads "I write about and explore the future of work!" To the right of the author information is a blue "Follow" button with white text. At the bottom left, the date "Aug 19, 2014, 12:04am EDT" is shown. The main content of the article begins with a paragraph about privacy concerns and a documentary, mentioning Facebook, Google, and Apple.

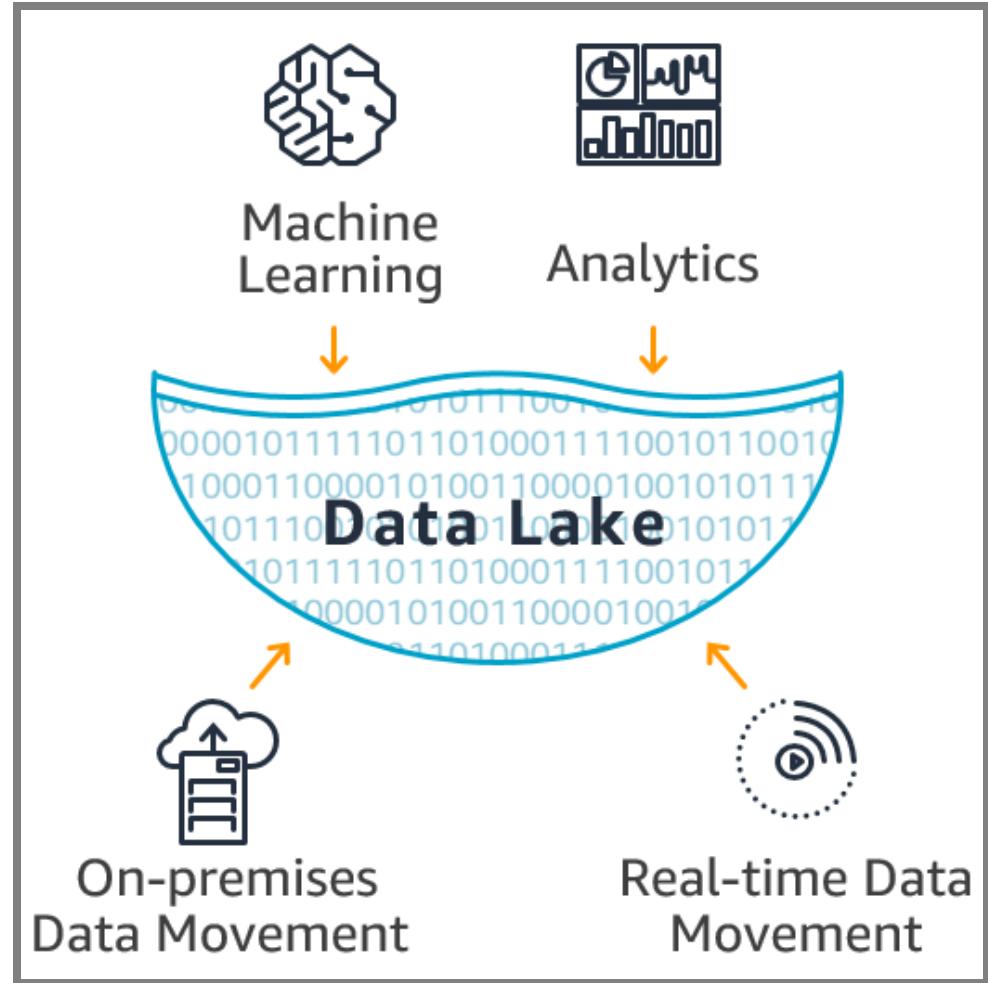

Privacy...everyone keeps talking about it and apparently everyone is concerned with it, but going forward does it even matter? I recently watched the documentary, “Terms and Conditions may Apply,” which provides a fascinating look at how organizations such as [Facebook](#), [Google](#), [Apple](#), and others have changed the way they look at and approach privacy. After watching the movie it had me wondering, “does privacy even matter anymore?”

Is Privacy Dead?

Data Privacy vs Utility

Cambridge Analytica, a political data firm hired by President Trump's 2016 election campaign, gained access to information on 50 million Facebook users as a way to identify the personalities of American voters and influence their behavior.

- ML can leverage data to greatly benefit individuals and society
- Unrestrained collection & use of data can enable abuse and harm!
- **Viewpoint:** Users should be given an ability to learn and control how their data is collected and used

US FTC's Fair Information Practice Principles

- Notice/awareness (core principle)
 - Disclose practices
- Choice/consent (core principle)
 - Opt-in, opt-out
- Access/participation
 - Users should be able to review & correct their information
- Integrity/Security
 - Ensure is secure, limited access
- Enforcement
 - Mechanisms for handling violations

LINDDUN Taxonomy of Privacy Threats

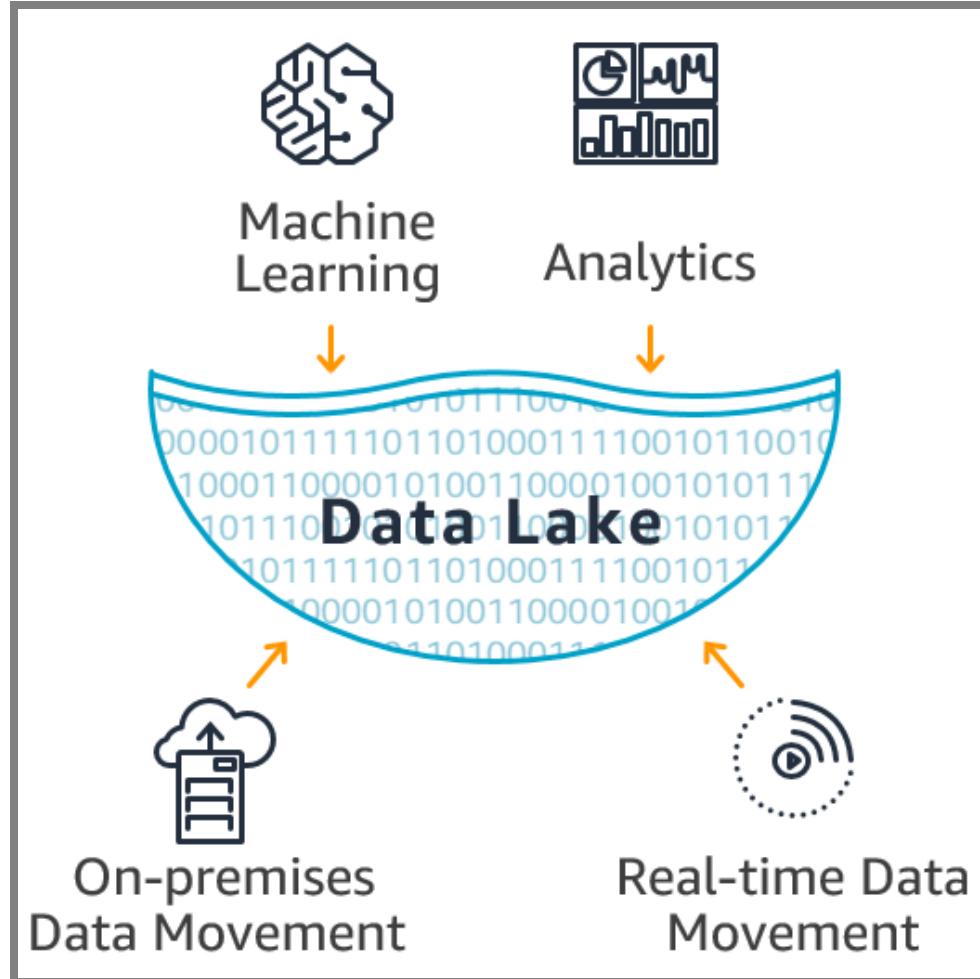

Best Practices for ML & Data Privacy

- Data collection & processing
 - Only collect and store what you need
 - Remove sensitive attributes, anonymize, or aggregate
- Training: Local, on-device processing if possible
 - Federated learning
- Basic security practices
 - Encryption & authentication
 - Provenance: Track data sources and destinations
- Provide transparency to users
 - Clearly explain what data is being collected and why
- Understand and follow the data protection regulations!
 - e.g., General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), HIPAA (healthcare), FERPA (educational)

Best Practices for ML & Data Privacy

- Data collection & processing
 - Only collect and store what you need
 - Remove sensitive attributes, anonymize, or aggregate
- Training: Local, on-device processing if possible
 - Federated learning
- Basic security practices
 - Encryption & authentication
 - Provenance: Track data sources and destinations
- Provide transparency to users
 - Clearly explain what data is being collected and why
- Understand and follow the data protection regulations!
 - e.g., General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), HIPAA (healthcare), FERPA (educational)

Collect and store only what you need

Realistic when data is seen as valuable?

Data Anonymization is Hard

- Simply removing explicit identifiers (e.g., name) is often not enough
 - {ZIP, gender, birthd.} can identify 87% of Americans (L. Sweeney)
- k-anonymization: Identity-revealing data tuples appear in at least k rows
 - Suppression: Replace certain values in columns with an asterisk
 - Generalization: Replace individual values with broader categories

Best Practices for ML & Data Privacy

- Data collection & processing
 - Only collect and store what you need
 - Remove sensitive attributes, anonymize, or aggregate
- **Training: Local, on-device processing if possible**
 - Federated learning
- Basic security practices
 - Encryption & authentication
 - Provenance: Track data sources and destinations
- Provide transparency to users
 - Clearly explain what data is being collected and why
- Understand and follow the data protection regulations!
 - e.g., General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), HIPAA (healthcare), FERPA (educational)

Federated Learning

- Train a global model with local data stored across multiple devices
- Local devices push only model updates, not the raw data
- But: increased network communication and other security risks (e.g., backdoor injection)

ML@CMU blog post on federated learning

Best Practices for ML & Data Privacy

- Data collection & processing
 - Only collect and store what you need
 - Remove sensitive attributes, anonymize, or aggregate
- Training: Local, on-device processing if possible
 - Federated learning
- Basic security practices
 - Encryption & authentication
 - Provenance: Track data sources and destinations
- Provide transparency to users
 - Clearly explain what data is being collected and why
- **Understand and follow the data protection regulations!**
 - e.g., General Data Protection Regulation (GDPR), California Consumer Privacy Act (CCPA), HIPAA (healthcare), FERPA (educational)

General Data Protection Reg. (GDPR)

- Introduced by the European Union (EU) in 2016
- Organizations must state:
 - What personal data is being collected & stored
 - Purpose(s) for which the data will be used
 - Other entities that the data will be shared with
- Organizations must receive explicit consent from users
 - Each user must be provided with the ability to view, modify and delete any personal data
- Compliance & enforcement
 - Complaints are filed against non-compliant organizations
 - A failure to comply may result in heavy penalties!

Privacy Consent and Control

The image shows a screenshot of a privacy consent banner from TechCrunch. At the top left is the TechCrunch logo (TC). Below it is the slogan "Your data. Your experience." followed by a paragraph of text explaining data storage and access for advertising purposes. A section titled "Your personal data that may be used" lists three items: device information, browsing activity, and precise location. Below this is a note about reading the Privacy Policy and Cookie Policy, which is highlighted with a blue oval. At the bottom are two buttons: "I agree" (green) and "Manage settings" (white).

TC

Summary: Best Practices for ML & Data Privacy

Be ethical and responsible with user data! Think about potential harms to users & society, caused by (mis-)handling of personal data

- Data collection & processing
- Training: Local, on-device processing if possible
- Basic security practices
- Provide transparency to users
- Understand and follow the data protection regulations!

Summary

- Security requirements: Confidentiality, integrity, availability
- Threat modeling to identify security req. & attacker capabilities
- ML-specific attacks on training data, telemetry, or the model
 - Poisoning attack on training data to influence predictions
 - Evasion attacks (adversarial learning) to shape input data
 - Model inversion attacks for privacy violations
- Security design at the system level: least privilege, isolation
- AI can be used for defense (e.g. anomaly detection)
- **Key takeaway:** Adopt a security mindset! Assume all components may be vulnerable. Design system to reduce the impact of attacks.
